EXTRACT

*From an Act prescribing Rules for the Government of the State Library,
passed March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 13. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

Mining and Scientific Press Patent Circular.

To Inventors

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Established in 1860.

Our business has been long and successfully practiced, and we are thoroughly responsible for the confidence and valuable trusts placed in our charge. Our advice can always be relied upon as correct.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with and have full records of all former cases, and can more correctly judge of the value and patentability of inventions discovered here, than any other agents.

Steps Necessary to Procure a Patent.

The first thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, of hard wood or metal, or both, and varnished or painted; the name of the inventor and the name of the article should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention, and the relation of the new to the old parts of the machine.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, San Francisco. Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operation.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by registered letter, post office order, or by draft on San Francisco, payable to our order. Always send a letter with the model, and with the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of \$15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and acknowledgment before a Notary Public or Justice of the Peace, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of \$20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and at the expiration of two years the invention therein described shall become public property as against the applicant thereof.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, (unless they are of common and well known character), and also of the manufactured article itself must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case the applicant has only to send us an exact description, and what it is desirable to claim.

For Designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances two photographs, with the negatives, answer well instead of drawings.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication, usually the business can be well done by correspondence.

The usual time required to secure a patent, when the case is conducted at our agency, is from one to two months. We sometimes get them through in two weeks. In rare cases, however, owing to delay on the part of Government officials, the period is sometimes extended for months. We make a special point to advance our cases as rapidly as possible, and have been successful in obtaining patents for this coast more surely and speedily than any other agency in the United States.

Letters Patent and Who Can Obtain them.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in

Mechanical Movements from Dewey & Co's Pamphlet Circular.

PLATE I.

PLATE V.

The explanations of the above and many other illustrations is contained in our Free Circular, which will be sent free on receipt of postage stamp.

the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years. Citizens of Canada and Nova Scotia have to pay a fee of \$500 for patents in the U. S., owing to discriminations made against Americans.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

A majority of the Patents issued during the past eight years to Pacific Coast inventors have been secured through our Agency; consequently we can more readily and correctly advise new applicants than any other agent.

Important Advantages.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights much sooner than by trusting the same to distant agencies, situated at New York or Washington.

Many inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use. A personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

By an able and faithful representative of our firm in Washington, our clients' applications are guarded against indifference examination, unfair treatment in any contingency, and hazardous delays.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent to-

gether with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the thousands of inventors and patentees on this coast who have patronized us.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 years and 6 mos.....	10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On the grant of every extension.....	50
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

Reasons for Success.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, by COMPETENT and RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions promiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small affairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

To Eastern Inventors.

Our close proximity to British Columbia, Mexico, Central and South American States, Australia and the Islands, enables us to obtain Letters Patent for you with much less delay and expense than they can be secured through any other agency in the United States.

Melbourne, in Australia, is a city of larger proportions than San Francisco, besides the adjacent colonies are of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Interferences.

INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patentees are threatened with interference they should consult able and responsible agents before they either allow themselves to be backed down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be persistently urged before the Examiner, and if possible the decision reversed.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Subscribe for the

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY.

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harper's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries, throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price \$5 per annum.

Circulars Free.

Assignments.

We make out assignments in the most substantial legal and improved forms, record the same in the Patent Office at Washington, and return the papers to the assignee, at a total cost of \$5.

Assignments of extra length or of a special character, will be made out and recorded on the most favorable terms.

Assignments already made will be examined and opinions rendered regarding their validity, and the assignments recorded, when desired, for a moderate fee.

Unsuccessful Applicants.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Our long experience as editors and publishers M. & S. P. guarantees our familiarity with most of the subjects of patents on this coast, and insures inventors a more ready understanding of their cases than they can secure from any other quarter.

It is not the duty of any government official in or out of the Patent Office to prepare patent papers, or make models. These must be provided by the applicant or his attorney, according to law, otherwise his claim will not be considered.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 Clay street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room counting room, and newspaper printing office—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

Home Counsel.

We are frequently consulted by persons who have rejected cases which they sent months previous through distant agencies—(hastily paying their first and last government fees, expressage, and extraordinary charges of agents)—when we could have shown in the start precisely similar drawings and descriptions in the Patent Office Reports in our office, thus saving such applicants their useless expenditure of money and their long suspense.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive free advice of importance to them, from a short call at our office.

In Our Library

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of

British patents from 1801, and full files of scientific papers containing illustrations and list of U. S. Patent Claims; Illustrated Mechanical, Philosophical, and Law Books and Reports, of the very highest authority, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office full copies of a large majority of the patent cases emanating on the Pacific Coast.

Copies of Patents.

Full copies of U. S. Patents will be furnished in the shortest time possible, at favorable rates.

Copies of the claims of U. S. Patents will be furnished without delay, from the reports in our office, at trifling expense. State the name of patentee and assignee, and date and No. of the patent, if possible.

Copies of Patents in foreign countries expeditiously furnished at moderate rates.

EXTENSIONS.—U. S. Patents issued prior to 1861, are subject to extension for seven years, provided some ostensible reason can be shown the Government for so doing. Patentees who have, from circumstances beyond their control, been deprived of the full benefit of their patents for any considerable time, are usually successful in obtaining an extension of the same, when presented through our agency.

INFLUENCE AT WASHINGTON.—No inventor can possibly have better facilities or more influence (through friends or agents, at Washington or elsewhere), to secure their patents sooner or more surely, than ourselves. Our influence at Washington is unrivalled, so far as success for applications from the Pacific States and Territories are concerned.

Illustrate your Inventions.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our clients no more than the price of a first-class engraving.

Superior Engraving Done.

We have superior draughtsmen employed in our office, and take special pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

With a poor representation we desire to have nothing to do, as it would be calculated to injure both the inventor and ourselves.

Too many ingenious inventors lose the product of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

More valuable patent rights have been sold on the Pacific Coast by reason of the information given of them by illustrations in the MINING AND SCIENTIFIC PRESS, than through any other source. The cost of such illustrations is little in comparison with the satisfaction gained.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street below Sansome, San Francisco.

Advertising and Subscription

Rates for the Mining and Scientific Press.

Subscriptions in Advance:—One year, \$5; Six months, \$3; Single copies 12¢; Monthly, \$5 per annum; QUARTERLY SERIES (stiff paper binding) \$5 yearly.

Lowest Rates for Advertising:

We shall adhere to the following rates:—(valuable in gold coin) for advertising in the MINING AND SCIENTIFIC PRESS from this date:
One column, one year.....\$400 00
Half column, one year.....200 00
One column, six months.....200 00
Half column, six months.....100 00
One column, three months (13 weeks).....100 00
Half column, three months.....50 00
Per line (smallest type) one year.....3 00
Per line (30 lines or more) one year.....2 40
Per line, three months.....1 00
Per line (30 lines or more) three months.....50 00
Per line, one month (4 weeks).....50 00
Per line (10 lines or more) one month.....40 00
Per line, one week.....25 00
Per line (10 lines or more) one week.....25 00

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

All advertisements in the Press appear in both the MONTHLY and QUARTERLY SERIES of the MINING AND SCIENTIFIC PRESS, which (by special arrangement) are placed for FREE READING in the principal hotels, steam-boat and steamship saloons, depots, and public reading rooms and libraries in San Francisco, and the Pacific States. Many volumes are also bound, thus affording permanent advertising.

The Press now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains. In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—our advertisers. Better references, or more reliable names, cannot be found in the advertising columns of any newspaper in the world. **DEWEY & CO.,**

DEWEY & CO.,

U. S. and Foreign Patent Agents, 414 Clay street

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the MINING AND SCIENTIFIC PRESS. Established in 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

ENGRAVING ON WOOD

DESIGNING AND ENGRAVING on wood and for electrotypes cuts of every description, done by superior artists at the office of the MINING AND SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc. Prompt execution and reasonable prices.

DEWEY & CO.,
No. 414 Clay street, S. F.

ELECTROTYPING ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, or name-cards and other embellishments to suit the various branches of industry in this State.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

"TIDAL WAVE" OFFICE, SILVER CITY, }
LEAVE, FEBRUARY, July 27th, 1869. }

MESSRS. DEWEY & Co.—GENTLEMEN:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfaction upon mine.
Yours, etc.,
J. S. BUTLER.

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & Co. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.
Respectfully,
GEO. INWOOD.

SUBSUN CITY, Cal., June 26, 1869.
MESSRS. DEWEY & Co.—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business with him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, }
RICHARD KNOTT.

PORTLAND, Oregon, May 2, 1869.
MESSRS. DEWEY & Co.—Gentlemen:—Receive my kindest thanks for your attention in the matter of bringing my application for a Patent to a successful issue.
THOMAS MANN

GRASS VALLEY, Dec. 2, 1868.—MESSRS. DEWEY & Co.:—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your untiring success. Yours, respectfully,
SYMONS & HARRIS.

LEXINGTON, April 3, 1869.
DEAR SIR:—The Letters Patent have just come to hand. For the prompt and business-like manner with which you have put the matter through, please accept my thanks.
GEO. W. TEASDALE.
To DEWEY & Co., Publishers M. & S. Press.

STOCKTON, April 8th, 1869.
MESSRS. DEWEY & Co.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours,
W. R. WATSON.

SOMERSVILLE, CAL., August 25th, 1869.
MESSRS. DEWEY & Co.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
GEO. HAWKINS.

MARYSVILLE, CAL., August 18th, 1869.
MESSRS. DEWEY & Co.—GENTLEMEN:—Enclosed and \$20 (currency) for last fees on patent for gang plow. I am very much surprised, after opinions received from Mann & Co. I am, respectfully, yours,
F. A. H.
The original of the above letter (and many others with similar reference to other agencies) can be seen at this office, in cases for which we have secured patents for inventors who had been denied patents, or who had paid for being told that they could not obtain patents. Inventors on the Pacific coast are fast learning to patronize first-class home agents, who better understand their cases and will give more thorough attention to every invention entrusted to their keeping.

JAMESTOWN, CAL., July 6th, 1869.
MESSRS. DEWEY & Co.—GENTLEMEN:—The Patent for our Oil Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours,
WM. G. HESLER.

THE RIGHT STAMP!—One of our wide-awake California inventors (who has already received two patents through this office) evinces the true winning spirit in the following note:

SAN JOSE, Cal., June 22, 1869.
MESSRS. DEWEY & Co.:—A few days ago I received your letter apprising me of the rejection of my case, etc. Well, under the circumstances, I will just say, "Let 'er rip!" and I will remember the indefatigable Zack Taylor's advice to his soldiers—"Pick your fire and try it again." I will have to try and get even on something else. I am satisfied you have done your duty as agents. Yours,
J. F. C.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—S. F. Spiritual Light.

NEVADA CITY, Nov. 3d, 1868.
MESSRS. DEWEY & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successful prosecution of my application for a patent on my "Hot Mining Shovel." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,
Very truly yours,
LEE D. CRAIG.

SAN FRANCISCO, April 19, 1869.
MESSRS. DEWEY & Co., Patent Agents.—Gentlemen:—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours,
O. E. JAYCOX.

MARYLAND, Cal., June 26, 1869.
DEWEY & Co., Patent Solicitors.—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly,
J. M. JOHNSON.

Number 1.

DOUBLE SHEET—24 PAGES.

Deep Well and Mine Pumps.

A neat device for raising water from a considerable depth, and in a continuous stream, is the one here illustrated. This pump consists of a barrel, surmounted by an air-chamber. To the top of this chamber is secured, by means of an air-tight flange, a dip pipe, which is long enough to reach below the working surface of the water in the pump when in operation. Through a gland in its top works a plunger a little smaller in diameter than the bore of the pump, and to the lower end is attached a bucket fitting the larger bore of the har-

rel. The suction opening is at the bottom of the pump and the discharge on the side of the air-chamber near its lower edge.

On the up-stroke, then, the pump raises the water the same as a single-acting pump; but on the down-stroke the plunger displaces a quantity of water equal to its bulk, forcing it up, and thus keeping the flow constant.

These pumps have the reputation of being well constructed, of working smoothly and of giving general satisfaction. Any further information desired may be obtained by addressing W. M. Henderson, Superintendent Philadelphia Hydraulic Works, Evelina and Levant streets, Philadelphia.

DETAILED accounts of the late fire at Panama show a fearful loss of property and of life. There being no engines or apparatus for extinguishing the fire, until that of the railroad company was brought to the place, the flames had undisputed sway until a large part of the city was laid in ashes.

OLIVE LOGAN has at last reached the Pacific Coast. This week she delivered two lectures in this city, unfortunately the only two she is to give. Her manner is very prepossessing and her lectures interesting in a high degree.

Earthquake-Proof Chimney.

Having gotten up a reputation for earthquakes here in our State, we are now enjoying the fruits thereof. All the Eastern States look on us as standing on the brink of an abyss which is about to yawn at every moment, and our own people are inventing devices which they fondly label as "earthquake-proof;" although these may in reality be more useful in other respects than in merely withstanding the shocks of Mother Earth.

Among the devices thus labelled is the one we here illustrate. Without doubt it

two pipes, one inside of the other, with the annular space between them filled with cement, plaster of paris, asbestos, or other non-conducting material. This flue is secured to the cover, which is fastened to the lower part of the chimney by rivets or other proper means. The illustration shows the device with one fire-place and one flue. But it can easily be constructed for two fire-places, opening into adjoining rooms on opposite sides of the chimney.

The chimney may be placed directly on the floor, if necessary, and any suitable fire-proof fire-place can be constructed in the recess in the lower portion. Heating-

MANN'S PATENT EARTHQUAKE-PROOF CHIMNEY.

obviates the liability of brick chimneys to occasionally topple over; but as we do not live in constant apprehension of the earth's rising or opening and throwing over chimneys on our heads; as we, indeed, fear these shocks less than those of the winds, which have been committing such devastation at the East of late; and as, finally, our chief apprehensions of danger from our chimneys are rather on the score of fire, than on any other ground, we should prefer to call this a fire-proof, or even a wind-proof, rather than an earthquake-proof, device. The reader can adopt either term he chooses, or all these, if he will.

The chimney is constructed entirely of metal. The lower portion, made of cast, sheet or boiler iron, with a proper opening for a fire place (which may be built of brick), is of any suitable shape and is intended to rest upon any foundation or upon the floor, if desired, as the whole weight of the chimney will not exceed six or seven hundred pounds. The left-hand figure shows the general appearance of this lower portion. On the right is the chimney-flue, shown in section also, in the middle figure, and below this, is the cover for the lower portion.

The flue is cylindrical and consists of

drums may be connected with it at any point, and thus the heat is utilized for warming rooms to a very great extent. It is so light that it is quite applicable when a fire-place is needed only in the upper story or stories of a building. The exposed part of the iron can be painted so as to represent brick-work, or ornamented as desired.

Besides this possibility of a cheap and easily-constructed chimney which can be placed in any room, are to be added its fire-proof qualities. As the pipes are made breaking joints, there is no danger of fire should the chimney be racked. This is a point of no small importance.

Benjamin F. Mann of Oakland holds a patent for this invention, which was secured him through the SCIENTIFIC PRESS PATENT AGENCY. To him apply for further information.

THE DENVER RAILROAD.—The completion of this road is an epoch in the history of Colorado. This and the projected road to Georgetown will greatly aid the mining enterprises of this go-ahead Territory.

New York and Brooklyn send on word that they are having little experiences in the way of earthquakes.

Journalistic Etiquette.

When we see, going the rounds of the press, a selected article which we have taken some pains to disentangle from its original mass of long-winded verbiage and condense into a "taking" shape,—crediting it, nevertheless, to its source without charging anything for our services,—when, we say, we see this going the rounds, we rather like it. It gratifies our self-love, because it shows us that we have succeeded in making a readable article of it,—and it gratifies our love for our neighbor, because it shows us that our neighbor knows a readable article when he sees it. But it is not so gratifying, when after taking extra pains with an article, and modestly calling the attention of our readers to that fact by commencing somewhat in this wise, "We condense the following from the *Ensign*,"—we see it copied in that exact form into—for example—the *Scientific Journal*. This we confess grates slightly upon our feelings. We would mildly hint that courtesy requires the *Scientific Journal* rather to say "The *Press* condenses," etc. But the crowning aggravation of all is to see the aforesaid article, thus strutting in borrowed feathers, transferred *verbatim* to the columns of the *Polymer Review*, and credited to the *Scientific Journal*!

Seriously:—We hold that a journal which takes the pains to worm out and present the *pith* of a valuable article which would otherwise, owing to its great length, or its obscure diction, fail to reach those readers whose time

is precious, is quite as deserving of credit as a journal which translates such an article from a foreign language.

A DESERVED HONOR.—W. T. Wenzell, of Mayhew & Wenzell, has been appointed one of the committee on the revision and publication of the National Pharmacopoeia (or compilation of rules for compounding medicines, etc.) for 1870. Every ten years a national convention of delegates, appointed by the various medical colleges of the country, meet at Washington for the purpose, and after discussing the subject requiring attention, appoints the committee named above. Mr. W. has received the honor of being selected as a member from this coast.

RECEIVED.—From Bancroft & Co., "Mrs. Hill's New Cook Book," and "Guilty or Not Guilty." These and Mr. Cronise's pamphlet on the "Agricultural and Other Resources of California," will be noticed next week.

FISHER'S HYDRAULIC NOZZLE.—Owing to the failure of the engraver to finish the cut in time, we are obliged to defer illustrating this excellent device until next week.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

WILL SMELT.—*Chronicle*, June 18th: On Monday, smelting the Leviathan copper ores will probably commence. The works consist of two furnaces and a 15-horse power engine. The furnaces will smelt six tons each per day.

EXCHEQUER.—Manager Chalmers will soon be ready to take out ore. Lumber for hoarding nouse is being hauled.

CONCENTRATION.—Works for a concentration upon the low-grade ores of the Tarshish will be erected at the Monitor C. Mill next week.

NEW START.—We notice a gang of men starting a tunnel for opening up the old Isis claim, now known as the Hidden Treasure.

AMADOR COUNTY.

KNNEDY.—*Dispatch*, June 25th: This mine continues to yield rock of almost fabulous richness. The only drawback now is the want of sufficient water to run the mill with.

RICH STRIKE.—We are informed that a large quantity of rock has been taken out of the Potosi mine, near Drytown, which will yield \$150 to the ton.

CALAVERAS COUNTY.

PALOMO.—*Chronicle*, June 25th: We understand that the additional battery of 20 stamps commenced operations yesterday. This augments the number of stamps to 36.

TO BE CRUSHED.—Lewis & Co., Wet Gulch, are hauling quartz to the Burr mill in Railroad. They have 25 tons mined. The new hoisting works are doing good service.

SHEEP RANCH.—One hundred and twelve tons of ore from the McNair claim yielded \$24 per ton in Armstrong's mill. Several other mines on the same lead are producing high-grade ore. Quartz operations generally are remunerative. The rock taken out is now worked by means of arastras. A 20-stamp battery would do the work of all the arastras in the district.

RICH.—Mr. Peter Davis has been prospecting his mine in Monitor district. At the depth of 50 feet a solid, well-defined vein, seven feet in width, is shown, and the rock prospects handsomely. The mine is admirably located for working.

NEW MILLS.—We understand that two quartz mills are to be erected in Whisky Slide. One is to be put up on the old Whisky Slide lead. The other is for custom work.

EL DORADO COUNTY.

GEORGETOWN.—Cor. of *Placerville Democrat*, 25th: I find there is a larger number of claims being worked than for several years. The Eureka is paying about twenty-five ounces of amalgam per week, which is something over expenses. The ledge prospects better than at any time since the claim was opened. If the sulphurets pay half what they assay, the company is doing well. Danes & Urey are working their claim on Hungry Point, and thus far it has paid wages. The seam is narrow, but widening. They are down fifty feet. The claims at Georgia Slide and Jones' Hill are all doing well.

GREENWOOD.—Cor. of *Stars and Stripes*, 23d: The St. Lawrence hydraulic claim and the McMichael and Nagler claims are working three new men, with an average yield of fifty ounces per week. The French claim has been paying for years large dividends to its owners, Desmarchais & Co., who average forty ounces per week. The Greenwood claim has been fitting up more extensive hydraulic operations. The Never Sweat, owned by Curtis, Nager & Brown, is being opened into paying ground. The Spanieh mill has been shut down on account of mismanagement. The Cedarberg & Brown is known as a "seam claim," and rumor has it that they are taking it out by the bucketful.

INYO COUNTY.

BULLION.—Los Angeles *News*, 25th: Three hundred and sixty-eight bars, weighing thirty-two thousand six hundred and thirteen pounds, were yesterday forwarded to Wilmington by railroad, whence it will be shipped to San Francisco. It is from Owen's river district, and shipped by the Owen's Lake Silver and Lead Co.

NEVADA COUNTY.

PITTSBURG.—*Transcript*, 22d: This mine is paying largely. On Monday they melted a bar of gold valued at \$5,000, the yield of four days' run with ten stamps. Two new furnaces have been erected, one for retort-

ing and the other for melting. Eighty men are employed at the mine and mill.

MANHATTAN.—This company, recently incorporated, is opening a mine on Gold Flat. The owners purchased the engine and hoisting works on the Wagoner ledge, which have been erected on the Manhattan, and will be started up to-day.

POTOSI.—Same of 23d: The shaft is down 22 feet, where they have a ledge of decomposed quartz and ochre, from which they obtain fine prospects. They have out three or four tons of quartz, which looks well.

NORTH SAN JUAN.—Same of 24th: The new ditch into San Juan and Sebastopol, by Spooner, Brown and others, will be 19 miles in length, and have a capacity of 1,000 inches. The survey is completed. Mining operations at San Juan are progressing satisfactorily.

At French Corral, Kate Hayes Flat and Empire Flat, extensive preparations are being made for working this summer. The claims of Poulinier & Co. are just fairly being opened.

At Birchville, but little mining is going on, the best of the claims having been worked out. Two miles below Birchville some very valuable claims, hardly yet touched, will be in operation in a short time.

At Sweetland, two companies are at work and doing well. The Buckeye claims, lately sold to an English company, are yielding fair dividends.

BANNER.—Same of 15th: This mine has been turning out good pay for some months past, with the prospect of a steady yield. The lowest level is at a depth on the slope of the ledge of 620 feet, and they have procured pumping apparatus with the view of sinking another hundred feet.

PENNSYLVANIA.—We are informed that they have the water pumped out to the 300-foot level. This is the lowest level, but the incline is 90 feet deeper, which will soon be pumped out. The levels and drifts, as far as examined, are in good condition.

FIDELITY.—Same of 23th: The owners of this mine, above Washington, are negotiating for the purchase of the Salathiel mill, which they propose to remove to the Fidelity.

OMEGA CO.—We saw at the bank two gold bars worth \$5,000 each, the result of a partial clean-up of one of the claims of the Omega Water and Mining Co. The company are running two sets of claims and employ over 50 men.

BLUE TENT.—*Gazette*, 23d: Water for mining purposes is plentiful. The Sailor Flat Co. uses 300 inches day and night; Last Chance, 350 inches; Cressey & Belden, 400 inches; Killam & Co., 300 inches; O. S. Cressey, 200 inches.

PLUMAS COUNTY.

CRESCENT.—*Quincy National*, June 18th: The mill is running to its utmost capacity, and paying well. The company have commenced to sink their main shaft deeper at the Indian Valley mine; the ledge is finely developed in the bottom. Judkipe & Kellogg are working their usual complement of men in their mine and mill, at Cherokee. This mine pays a handsome dividend every month. Bachelder & Co. are crushing very rich rock—the richest ever taken out in Indian Valley.

SAN BERNARDINO COUNTY.

CLARK.—*Guardian*, June 18th: This district is attracting attention. It is 45 miles from Hardyville on the Colorado. The mine is being opened and a thorough system of mining inaugurated by a company of San Francisco capitalists represented by J. W. Crossman.

SIERRA COUNTY.

ITEMS.—*Messenger*, 25th: Baron Stech will resume his place as superintendent at the Kanaka mill. Ned Leonard's quartz mill has been running for the past two weeks.

TUOLUMNE COUNTY.

WORK RESUMED.—*Sonora Democrat*, 25th: A cut is being run from the Table Mountain Humbug tunnel to the New York tunnel. The law-suit between these claims is at last over. There is still enough ground for 10 or 12 years' work.

YUBA COUNTY.

BROWN'S VALLEY.—*Appeal*, 23d: The Dexter and the Upper Pennsylvania mills are in full blast, and the prospects encouraging. The Dexter made their clean-up on Tuesday, and the result is thought by outsiders to be satisfactory. The company keep their own counsel.

Arizona.

ITEMS.—*Prescott Miner*, June 11th: The bullion from between 60 and 80 tons of Box Elder ore was this week run into bars. It amounted to \$1,700. Reliable persons

are confident that the tailings contain as much. Big Bug boiler is undergoing repairs. Work goes on in the Hassayampa, Walker, Walnut Grove, Martinez and Wickenburg districts. The White Picacho mine, near Wickenburg, is said to be four feet wide, and the ore averages \$120 to the ton in silver.

Colorado.

ITEMS.—*Central City Register*, June 22d: Alf. Owens, Pleasant Valley, shipped last week \$3,000—sluiced out of the gulch. Joe Harper has struck pay. Three claims are being worked on the Gregory Second. On the Frank Dalton property the vein runs, under stamps, from 7 to 10 ounces per cord. Hussey purchased nearly \$11,000 in gold in the last three days. Capt. Phillips has a 12-inch vein of beautiful ore on the Jones lode. The old Central Co's property, on the Roderick Dhu, is turning out \$1,500 per week. Moss & Co., working four men in the gulch, between Walker's mill and Prof. Hill's works, are taking out \$17 per day to the man. Sudeberg ore, in stamp mills, yielded seven ounces of gold per cord. W. H. Stephens has fitted up the large stone mill in Nevada, and has it running. Worden & Smalley have leased Mose Hall's stamp-mill, in Eureka, and are running it upon ore from the Ingomar. Dr. Holland has men mining on the Champion lode, Trail Run. One cord of Clark & Thompson's Coyote ore gave, last week, in arastras, 17 ounces of gold. Large amount of ore in sight in the Central Co's mine, on the Prize lode. Shift 270 feet deep. Rollins' mill will run all summer.

GRAND ISLAND DISTRICT.—The Caribou is the most developed of the lodes. The crevice appears to be five or six feet in width, carrying from 10 to 20 inches of pay material. The principal shaft is only 60 or 70 feet in depth, but the vein has been struck for 800 feet. The Caribou Co. have 15 tons of fine looking ore out, and twice as much of a grade lower. The Poor Man, just below the Caribou, is a large lode, in which the pay material is twenty inches in width. It has the same characteristics as the Caribou, but scarcely any pitch.

ITEMS.—*Central City Herald*, 22d: Machinery for reduction works on Chicago creek, passed through town last evening. The Gilpin county mine is worked more profitably than ever. About 30 hands are employed. Mr. Cutter intends running an additional drift. At present, the ore is \$100 to the ton, and is easily mined. Mining is very active in Nevada district. Work has commenced on several leads, and a rich return is obtained. Quartz Hill has a lively appearance, and Nevada is jubilant. B. C. Waterman's new mill is unlike any other in the county, is a complete success, and is run by a New Jersey 75-horse-power engine. Nine mills, consisting of 124 stamps, are now running in Nevada district. A new shaft house has been built over the Spark's lode. The old Whitcomb mill keeps pegging away. The Gilpin mill, started by Mr. Lewis, is supplied from the American Flag and Prize lodes. Clayton's claim on the American Flag has improved. The last run yielded 19 ounces to the cord. Cy. Hurd is taking out ore from the same lode. He will commence sinking next week. Fitz Simmons & Co., on the discovery shaft of the California lode, are now at a depth of 180 feet. The last ore run went two and a half ounces to the cord. Clark & Co., of the Hidden Treasure, have reached a depth of 230 feet, and are taking out 8-ounce ore from a crevice from 20 inches to 7 feet in width. The old Lexington mill has been remodeled. The 24 stamps now crush 15 tons daily. It has been running on Roderick Dhu ore with an average yield of four ounces per cord. Hoppe & Co., on the Kent County lode, Quartz Hill, are down 175 feet, and have a crevice 12 to 18 inches in width. Clark & Bradley, on the Ralls County lode, have a 6-foot crevice with ore that yields nine ounces gold per cord. Chretley & Jones are down 100 feet.

ITEMS.—*Georgetown Miner*, 16th: V. T. Harris this week discovered a rich ore-deposit on the Jamez Guthrie lode, two feet wide. Discovery shaft on Cashier lode is 60 feet deep. Six tons ore gave \$230 per ton at the smelting works. A working force will soon be put on the Mendota. Morris' tunnel advances 10 feet per week. Nash tunnel has struck the west extension of the Equator lode.

Idaho.

ITEMS.—*World*: Meredith & Co. have cleaned up from their bill claims \$16,070, after a run of 45 days, and have not cleaned up the ground sluice yet. Col. Merritt has made a big clean-up on his bar

claims above town. He has been having bars run and assayed all day.

Montana.

CABLE CITY.—*New North-West*, June 17th: Mr. Cameron will start the mill next Monday. Some 25 or 30 men will be employed in the mine, and 10 in the mill.

SILVER BOW.—Cor. of same: The ditches are all full, but the diggings are not paying big. The largest run last week was \$800. The water will, however, last all summer.

ROCKER CITY.—Cor. of same: Water is plenty, and everybody working, but no further demand for labor. Some 20 companies have opened in the main gulch and are doing well. Rocker Hill is paying from \$10 to \$30 per day to the hand. Several companies are working in Oro Fino, and are making from \$8 to \$25 a day to the hand. A fresh supply of Chinamen have arrived in the gulch.

CEDAR CREEK.—No. 45 below discovery cleaned up on the 8th, half a day's work with five hands, \$200. Water rising compelled them to stop work. The unknown depth of the pay gravel on lower Cedar prevents each individual claim being opened, which has caused the owners to form companies and throw their ground together to get it drained.

In Oregon Gulch prospects as high as \$2.50 to five pans were struck above the falls near the old No. 125, and the boys have gone to work in earnest setting sluices, to test the gravel. McWhirk, Warren & Co., 59 above discovery, cleaned up on the 11th, with five hands, one day's work, \$900. Bonner & Welch to-day received word from a reliable claimholder at Cedar that he had just got his claim opened and run two and a half days, taking out \$980. The water was falling, and good pay was anticipated, but our report of the 15th says the water was again up.

ENGELAND.—*Helena Gazette*, 20th: Mr. W. D. Flowers yesterday showed us a clean-up on the Only Chance in the shape of a chunk of retort of 140 ounces. This mine is down 266 feet, and the vein is wider and better. The clean-up was from two beds only. Mr. Flowers had a patent just received from Washington for 1,200 feet on the lode. The tunnel for the Nevins lode has not yet reached the vein. The owners are taking out good quartz from their shaft, and crushing in their arastras. There are five bed-rock flumes being put down in the gulch. The Highland Gold Co's mill is silent at present.

RED MOUNTAIN CITY.—Cor. of same: Stamps & Co. have just struck bed-rock. The Flume Co. will soon do so. Langworthy & Co. will do it in 20 feet further. McLanahan and Co., at the mouth of Horse Gulch, have some rich ground. Mole & Linter have a bed-rock flume, and are doing well. Wm. Onslay, from Butte, has commenced a bed-rock flume on No. 17, 18, and 19. Connavan and Wilson are working discovery claim, but have as yet struck no pay grit. The Dixey Co., on Gold Hill, at the head of Moree creek, commenced building an arastra April 26th, and have just run one week, and cleaned up one tub, from which they took \$600. They have as much more to clean up yet. The Nonpareil, Pierce and Bros., have a splendid arastra. On Moose creek there are two leads, the Day and the Harvey, each down 125 feet. The Harvey shows a face of five feet. Wash. Stapleton has made a contract to pay \$100 per ton for the rock, and freights it to Argenta, 80 miles, to have it crushed.

WATER.—*Helena telegram*, 21st: A company have been formed in this city to bring water from a lake 20 miles distant, and \$40,000 has been subscribed. The ditch is to contain 2,000 inches of water. Work will be commenced at once. It will redeem some of the richest mining ground in the Territory.

Nevada.

GOPE DISTRICT.

GOOD YIELD.—*Elko Independent*, June 25th: Ten tons from the Mammoth mine sent to Reno gave a yield, over all expense, of \$1,530.

CRESCENT.—The ledge is explored to a depth of 200 feet by an incline, which exposes the ledge two feet in width. Last Monday the company had on dump 250 tons of ore that will work \$90 to the ton.

HUMBOLDT.

DUN GLEN.—*Register*, 25th: We are informed that a valuable discovery was recently made in the Alaska mine. When the shaft was down 60 feet they struck a vein four feet wide, which had the appearance of decomposed elata. Mr. Bowen fancied it contained traces of mineral, sent a sample to San Francisco for assay, and got a return of \$1,200 per ton. Judge

Cummings worked one pound, from which he obtained one ounce of silver.

STAR DISTRICT.—*Silver State*, June 21st: Several bodies of fine ore have been found in the Sheba, some of which will yield \$1,000 to the ton. The De Soto is yielding fine ore. The best is asked for shipment to Swansea, while the inferior grades will be subjected to concentration.

BATTLE MOUNTAIN.—Cor. of same: Martin & Hogan started their furnace upon the 13th. The Battle Co. have struck another ledge. R. McBeth has commenced work on the original location. The Sheba is taking out fine ore. The White mine has started work. The Avalanche has been pumped out. There will be three shifts of men worked. Smith & Thomas will start work on their extension, now that the Avalanche is pumped out. The Masonic shaft is down 50 feet. The ledge is 18 inches wide, showing fine mineral all the way. The Trenton has shipped 10 tons to Reno for reduction. The Little Giant employs 15 men. The Mary Ann has again commenced work. The Maggie Jones is panning out well. The Holbrook Co. are taking out fine-looking copper ore.

ALPHA.—Geo. Carmany has struck another ledge, one of the first in the county. It is in the South Mountain, and called the Ante.

BULLION.—For the week ending Monday, John C. Fall & Co. shipped to San Francisco 460 pounds of fine silver bullion, averaging .900 fine.

RAILROAD.—*Elko Independent*, June 22d: The furnace of Rogers & Haskell will fire up to-day on Sweepstake ore. Then ore from the Bullion, 60 tons from which is at the furnace. The Iron ledge is showing pure chlorides. The California has passed from copper to rich silver-bearing galena. There are 20 mines taking out smelting ore. Ritchie & Co. are taking out ore from the Orphan Boy, which is copper thus far. The Bullion ore shows gold.

REESE RIVER.

GOOD FARM FROM BELMONT.—*Reveille*, June 20th: We mentioned that rich ore had been struck on the bottom of the incline of the El Dorado South mine. Yesterday a gentleman informed us that developments within the week have disclosed immense amount of ore of the highest grade. A few specimens from the dump will work at least \$1,000 per ton. The Buel mill is not work night and day on ore from the High Bridge vein. The supply is more than equal to the capacity of the mill. Leon & Co. contemplate the erection of a mill of their own.

BULLION FROM BELMONT.—Same of 22d: Five bars of the value of \$3,175 were shipped by Mr. Canfield yesterday.

THE EL DORADO SOUTH.—Same of 23d: Mr. Terry, from Belmont, brought us a chunk of ore weighing six pounds from the El Dorado South, at a depth of 270 feet. As a specimen it is unsurpassed in beauty and richness. Mr. Lundhorn, who is familiar with the ore, says it will go \$2,000 per ton. When we add that the vein is nine feet wide, and that none of it will work less than \$100 per ton, some idea may be formed of the value.

BIO SMOKY.—Capt Dahlgren has rented the Sterling mill at Kingston, and will place it in running order, with a Stetefeldt furnace.

MINERAL HILL.—*Elko Chronicle*, June 26th: Huher & Curtis are building a first-class 10-stamp mill, with Stetefeldt furnace. The Austin Co. are taking out high-grade ore. In the Giant shaft they are taking ore from a 5-foot vein worth \$500 per ton. The Live Yankee is turning out ore from a 14-foot vein worth \$300.

WASHOE.

BULLION.—*Gold Hill News*, June 25th: Stock to be increased from one million to two. In the 500-foot level they have drifted 300 feet.

HALE & NORRIS.—Daily yield, 260 tons; principally from the seventh level. The upper mine shows improved yield. The winze from the sixth level has made its connection, giving good air circulation. The cross-cut, 150 feet north of the shaft, has reached the west wall, showing a width of ore of over 40 feet.

OCIDENTAL.—Yielding at the regular rate. The lower tunnel will intersect with the winze within two weeks. The foundation of the new mill is completed, and the frame commenced.

YELLOW JACKET.—Yielding 250 tons of high-grade ore daily; also 150 tons of low-grade from the upper levels.

IMPERIAL-EMPIRE.—The winze is down to the level below. Sinking in the main shaft is resumed. A deposit of fair grade ore has been found in the old workings of the Imperial mine.

CHOLLAR-POTOSI.—Yielding 220 tons per

day; average assays, \$66. The Belvidere section shows improvement.

GOULD & CURRY.—Daily yield, 70 tons; average assays, \$50.

SACRAMENTO AND MENEDITH.—The ore exposed consists principally of a huge gravel deposit, mixed with quartz boulders, rich in gold. In fact, the deposit is worked for the gold alone. The mill operates well.

VIRGINIA CONSOLIDATED.—A considerable amount of high-grade ore is yielded from the upper mine, through the old Sides tunnel.

CONFIDENCE.—Much surface ore has been shipped to Carson, but the supply falling off, it was shut down on Wednesday.

SIERRA NEVADA.—The surface gravel deposits show improvement. The east body looks especially well. The new mill is running well.

BELCHER.—The 152-foot level improves in drifting north, and gives increased yield.

CALEDONIA.—Daily yield, 40 tons, from the 200-foot level. The mine is looking well.

HOPKINS.—About 18 tons of low-grade ore is daily extracted from the upper level. The lower levels yield 30 to 35 tons of \$20-ore per day.

OPHIR.—The water is again out of the new shaft, and work is resumed in the lower drifts.

CROWN POINT.—Daily yield, 45 tons low-grade ore, from the upper levels.

KENTUCKY.—Daily yield, 26 tons.

OVERMAN.—*Enterprise*, 26th: A less amount of ore than usual has been extracted, obtained from the upper levels.

SCURRO TUNNEL.—The tunnel was in, yesterday, 1,270 feet. It is still in very tough blue clay. They have struck a very considerable vein of water—four inches. There are strong indications that a ledge will soon be reached.

NEW LEAD.—A lead, thirteen feet in width, and assaying over \$1,000 in silver and gold, has been found in Spring Valley, below Silver City. It is said that it can be traced to the northward three or four miles.

WHITE PINE.

ITEMS.—*News*: The Silver Wave have run into a fine ledge at the depth of 20 feet. The original Hidden Treasure is like a beehive. The tunnel facing Hamilton is in ore at the depth of 200 feet. The ledge is almost perpendicular. There are different stories about the Eberhardt sale. It is said that the English company have only agreed to give the figure named, after having inefficiently explored the mine to determine its approximate value. A few days since Walsh's men broke into deposits of black sulphure of silver, in the Trench mine. We have a specimen. It runs about \$4 to the pound. The Sampson mine had almost petered out of market eight. We now learn that things have been fixed up. The tunnel in the Silver Vault is progressing. Considerable work is being done on Blue Hill. The Domingo has a 60-foot front, and a large amount of ore on dump. The Cliff is taking out milling ore, which runs from \$20 to \$60 per ton. New development in the south Oregon shaft of a body of fine ore, showing a face of five feet. A drift is being run to connect the old works with this. The White Pine Smelting Works had been running continuously for 23 days, and the furnace was still as good as ever. The Pogonip and Othello are to be worked by an Eastern Co., who have effected the purchase of a two-thirds' interest. San Francisco and Revelle Mill and Mining Co. have sold their property in R-ville District, for thirty odd thousand dollars. The Cutter and two other mines, on Mount Ophir, are likely to change hands. Parties from Cincinnati have been to examine them. The party of three, under Prof. Peck, he of the divining-rod, have sunk 150 feet, and struck something supposed to be good. A Chicago party is on the way to put up a smelting establishment in White Pine. On the 24th the Voss furnace was in the 15th day of its run, with a prospect of as many more days. Bullion shipped for week ending 20th, \$28,236.

OUTSIDE DISTRICTS.—Buckeye mine, near Eureka, belonging to some Cornish boys, has been sold to Wm. M. Lent for \$65,000. There is a large amount of ore on the dump, which is not included in the sale. Eleven bars of silver, received from Ely, were milled in Raymond & Ely's five-stamp mill, and the ore was from the Ely mine—proceeds of two weeks' run. Value, \$10,000. Three smelting furnaces are now going up in Robinson District. Charley Hanson has sold his mining interest in Pinto for \$20,000 gold coin. The purchaser is Mr. Dunne, of the Truckee mill, near Reno. The 20-stamp mill at Egan is being remodeled for dry-crushing. The ledge is three and a-half feet wide, and

very regular. The hoisting works are perfect, and everything is arranged for permanent work.

ELY.—Pioche cor. of *News*: Armed forces in battle array three times lately. First.—Pioche Co. and Challenge Co. The latter had several tons of ore on, and proposed to send it to mill. Pioche Co. objected. C. Co. took it off without a shot. P. Co. served an injunction. Second.—Vermillion and Spring City P. Co. claims later. V. Co.'s forces hold the ground at present. Third.—P. Co. vs. Frank Wheeler and party. Latter built a fence. P. Co. tore it down. Fence rebuilt. Both armies drawn up. Old prospect holes used as rifle pits. Multitude of spectators on the hills around. Finally, P. Co.'s army went to supper, and the other crowd stepped in and took possession of the ground. In the morning a compromise was effected.

New Mexico.

THE NEW MINES.—*Santa Fé Post*, June 11th: Hon. J. D. Bail, of La Mesilla, writes: "We cannot speak with absolute certainty, because nothing but assays have been made, but taking everything together, we were forced to the conclusion that these mines are among the richest ever discovered. In size and extent they are unsurpassed. * * * One-sixth interest in the Brown lode has been sold, as I learn, to Haywood & Co., of California, for \$35,000. * * * The ledges are from thirty to sixty-five feet wide, boldly projecting above the surface from thirty to forty feet, and are plainly visible for fifteen miles."

ITEMS.—*Press and Telegraph*, June 18th: The Montezuma Lode West, Bartlett & Co., thirteen miles from this city, lies comparatively idle for want of capital to put machinery upon it. From the discovery shaft, at a depth of eighteen feet, we have a piece of quartz that assayed \$141 gold, and \$21 silver. The ledge crops out six feet, and is, in places, 100 feet wide. Prospects at Arroya Honda are encouraging. About 200 inches of water is running into Humbug Gulch, and the miners are in a pleasant condition of mind. James Decan has started a large rocker in Grouse Gulch, and from 350 huckets of pay dirt cleaned up \$29 in gold.

Oregon.

QUARTZ.—*Jacksonville Sentinel*, June 25th: We are informed that Sam. Bowden cleaned up, after crushing about 80 tons of quartz, on Jackson creek, \$2,500.

Wyoming.

NORTH PARK.—*Cheyenne Advocate*, June 9th: A gentleman just in states that there are now about 75 men in that district, some prospecting, others sluicing, and those who are industriously working are taking out from \$4 to \$8 per day to the man. He showed us a sack of dust containing \$135, which he had taken out with a rocker in 16 days, and several nuggets which were worth from two to seven dollars.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Mining Stock Market.

During the period under review, the mining share market has been characterized by a considerable degree of activity, if we take into consideration the present dull condition of trade generally, and the continued reticent disposition of outsiders to enter the stock arena. Several heretofore prominent stocks sold to a very large extent, at weakening rates.

IMPERIAL—was in the market to a larger extent than last week, at decreased rates. From the Secretary's annual report for the fiscal year ending May 31, 1870, we extract the following statistical data:

RECEIPTS.	
Cash on hand May 31, 1869	\$7,680 16
Bullion	156,893 53
Assessments	147,740 53
Gold Hill and Rock Point Mills	3,474 10
Property sales	15,000 00
Notes payable	22,000 00
Imperial Empire Shaft	2,406 89
Sundries	10,451 67
	\$379,642 98
DISBURSEMENTS.	
Gold Hill Mill	\$68,989 23
Rock Point Mill	3,295 58
Alta Mine	96,756 03
Holmes Mine	5,178 55
Imperial-Empire Shaft	82,945 63
Virginia and Truckee Railroad Co.	27,000 00
New Drifts	11,852 90
General expense	13,674 01
Expenses in San Francisco	8,470 35
Local expenses	10,633 53
Bills receivable	15,000 00
Sundries	9,765 55
Cash on hand, May 31, 1870	191 00
	\$379,642 98

The cost of reducing 12,020 tons of ore (including hauling) amounted to \$7 96 per ton, with supplies on hand. The cost of extracting 11,925 tons of ore from the old shaft amounted to \$7 20 per ton, including shaft repairs, sinking, etc. Since this Company went into operation, the expenses for milling and mining purposes, including new machinery and improvements, aggregate \$4,113,290, and the dividends paid stockholders foot up \$1,067,500. In the same time, the receipts from ores and sundries sold for account of mines and mills were \$5,303,517, and from assessments, \$291,740. At the date of this report, the total indebtedness of this Company was \$22,000; against which \$18,259 37 was due on assessment No. 7, and \$15,000 on bills receivable. Following are the names of the Trustees elected for the ensuing year: A. K. P. Harmon, J. D. Fry, Thomas Bell, S. W. Glazier, Robert Sherwood, James Freborn, and Thomas Sunderland. At a subsequent meeting of the Board the following officers were elected: A. K. P. Harmon, President; J. D. Fry, Vice President; D. A. Jennings, Secretary, and R. N. Graves, Superintendent.

CHOLLAR-POTOSI—sold to a considerable extent at improved rates. For the week ending June 24th, 1,320 tons of ore were taken from the mine, showing an average assay value of \$64 30 per ton. The Belvidere section has improved in both quantity and quality since the previous report. On the Potosi tunnel level, at the locality where the Belvidere body comes down, the prospects are reported to be excellent. Blue Wing is affording the usual quantity of ore. At the new shaft the first station drift west has small quantity of good ore, and prospecting in this section is steadily carried forward. Twenty feet more drifting will be required to connect the north drift with the Potosi fifth station. On the 28th eleven bars of bullion, valued at \$35,415, were sent forward to the office in this city.

HALE & NORRIS—changed hands to a less extent than the previous week, at rather well maintained figures. The product of the mine for the week ending June 25th amounted to 1,617½ tons of ore, 663 tons coming from the upper mine, and 954½ tons from the seventh station (lower mine) level; previous week, 1,716 tons. At the above date they had on hand, in the dumps, 6,156½ tons. On the 23d ult. the winze had attained a depth of 16 feet below the seventh station, car samples of ore taken from it showing an assay value of \$53 per ton. The south drift is being continued from the seventh station, the ore in the face showing \$30 to \$45 per ton, and at this date they had not ascertained the width of the ore body at that point. The ore breasts in the upper mine are reported to be extensive, and present a flattering appearance.

GOULD & CURRY—was in the market to a moderate extent. During the week ending June 27th they extracted 537½ tons of ore, the average assays from car samples showing \$50 84 to the ton. Considerable drifting has been done, but nothing of an encouraging nature has been found in the lower levels. The ore faces from the second station level up to the El Dorado floor show no material change. On the 28th of June they sent down \$11,396 of bullion.

BELCHER—is rather dull of sale. On the 27th of June they sent forward \$10,418. The general appearance of the mine does not give any very good promises. **KENTUCKY** has been quiet. During the week ending June 24th 277½ tons of ore were extracted, yielding \$6,070 56, equal to \$18 80 per ton. **CROWN POINT** produced 327 tons during the week closing June 24th valued at \$4,273 97, or \$13 07 per ton. **OVERMAN** sent down \$7,000 in crude bullion on the 24th of June. **OPHIR** has been tolerably active. On the 28th of June the following report was made: At shaft No. 1 work was progressing well; north drift in good ground, and southwest drift No. 1 still in very hard material. The southwest drift No. 2 is still in bad condition, but good progress is being made, and they are clearing out and retimbering the same. The improved price of **AMADOR** is thought to be due to the fact that in all probability no assessment will be levied. *Commercial Herald*.

REDUCTION WORKS AT OAKLAND POINT. Land has been leased at Oakland Point, on Center and First streets, for the erection of reduction works. The situation is such that ore can be delivered by the Western Pacific Railroad within fifty feet of the furnaces. The works are to be constructed in the most improved manner, and with the most complete arrangements for dispatching work.

Tarpping and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

When do Insects Attack Vegetation?

It is seldom that an insect attacks a perfectly healthy tree or other healthy vegetable growth; but let any tree or shrub be neglected, either in pruning, dressing or in any other way, and some insect will surely find it out. It has been said by an agricultural writer that insects answer a good purpose—they compel the owner to take care of his trees, or they will take them all to themselves.

Examine a tree which has been attacked by this horer; notice particularly where the worm entered, and nine times out of ten you will find that the tree was previously diseased at that particular spot. In the Eastern States there will generally be found a little hudge about the point of attack, produced by freezing and thawing in winter, and the subsequent efforts of the tree to heal itself—sap accumulates around the diseased part and produces an abnormal growth. In California, the horer seldom attacks a tree that is not *sun-burnt*. Has any one been troubled with horers here who has trained his trees to low branching, or otherwise protected their trunks from the direct and constant rays of the sun? If any have suffered who have taken such care, we think a careful examination will find that something else was wrong about the tree before it was attacked.

Observe a forest tree that has been cut down and allowed to lay upon the ground for any considerable length of time, and exposed to the sun, with the bark on. The borers have completely riddled it. Any one who has cut much dead-wood for fuel in California, must have been particularly struck with this fact.

What we say of the conditions under which insects attack trees is equally true of vines, shrubs and the cereals. The mildew of the grapes is due to a disease which has previously fallen upon the vine. A perfectly healthy vine, planted in a proper exposure, and cultivated as it should be, will never be troubled with mildew. An excess of moisture produces a disease of the leaf, upon which the sporulae lodge and find a congenial spot for taking root; while if the leaf is perfectly healthy, they will blow harmlessly away. It is very seldom that either worms or winged insects attack a perfectly healthy leaf or stem. There are certain exceptions, as when any locality is visited with an unusual number of such insects, as locusts, grasshoppers, etc.

If your wheat is properly cared for in the preparation of the seed, and in draining and preparing the soil, it will seldom be attacked with mildew or rust—never, in fact, unless disease is first induced by unpropitious weather. Good cultivation will also enable it to withstand an excess of either drouth or moisture, which, under an imperfect system of culture, would be ruinous to the farmer's hopes.

The evils of this life, generally, are not without their beneficial effects. Were it not for the penalties inflicted, the laws of Nature would be so constantly violated by man that this world would soon become a perfect chaos—both morally and physically.

THE TEA PLANTS AT CALISTOGA.—The report circulated a week or two since, with regard to the unfavorable condition of the tea plants of Sam. Brannan's estate at Calistoga, is now contradicted. At least 100,000 of them are throwing out roots and giving every sign of vigorous life. The tea seeds, large quantities of which were also sown last spring, are promising well.

APRICOTS and olives promise an unusually full crop in Los Angeles county.

Germination of Seeds, and the Preparation of the Ground Therefor.

Having examined somewhat minutely the origin, manner of fertilization and physical construction of seeds, it will be both interesting and profitable now to inquire into the conditions of their germination, and learn how we can best assist Nature in the operations of plant growth. In this inquiry we must first obtain a clear view of the circumstances and conditions which best promote the germinations of the seed and give to the plant its first impetus of growth.

We have already seen that the seed contains the germ, or, rather, the embryo of

FIG. 1—CLODDY OR STONY SOIL.

the plant, every portion of which is there as fully as the rudiments of an animal are in the womb. If this seed is healthy, no matter how dry and apparently lifeless it may be to the touch and sight, it nevertheless possesses life and vitality, that needs but the proper conditions of warmth, moisture and air to become excited into activity. What that life is we know not, and cannot describe any more than we can embryo animal life. That is one of the hidden secrets of Nature. We merely know something of the circumstances under which that life can be excited into activity. These circumstances or conditions we now propose to examine by the aid of several hastily-prepared illustrations.

When a healthy seed is placed in the ground, nothing comes of it unless certain

FIG. 2—SOIL WITH WATER, BUT WITHOUT AIR.

conditions of warmth, air and moisture are present; and these must also be properly combined. Any very great excess of either will be fatal to germination or sprouting. Experience teaches us that the finer and more evenly we pulverize the soil, the more perfectly we secure the proper conditions; and the less fine and less uniform the particles of soil, the more imperfect is the germination and after-growth of the plant.

If a seed is placed in the ground as shown in Fig. 1, where there is a stone, *a*, upon one side and an unbroken, hard clod, *b*, upon the other side, with unevenly pul-

FIG. 3—SOIL WITH AIR, BUT WITHOUT WATER.

verized particles of earth elsewhere surrounding the seed, it is partially deprived of all three of the desirable conditions. The stone, by its easy transmission of heat, keeps the temperature near the seed too high in the daytimes and too low at night, while both exclude air; consequently the circumstances are unfavorable for germination.

In Fig. 2, the seed, *a*, is placed in a fine and evenly-pulverized soil, but where the

interstices are entirely occupied by water instead of air, while the interior of the particles of earth are also filled with water. (In each of the figures herewith given the dark portions represent water, the light, air, and the straight lines, earth.) It is clear that in Fig. 2 the seed must be almost entirely deprived of air—one of the indispensable conditions of germination. The excess of water, moreover, renders the earth around the seed too cold to meet the proper conditions of warmth required. The evils of the excess of moisture may be readily and intelligently studied by the aid of this figure.

Again, in Fig. 3, a total lack of moisture is observed;—none is seen in the interstices, none within the particles of earth—nothing but air and earth is shown. Under such conditions heat finds an easy access to the seed and as easy an escape. The want of moisture and excess or irregularity of heat must be fatal to germination.

Fig. 4 represents the seed deposited in a soil properly pulverized; while between every particle of soil the air finds ready access, and in the interior of every particle of soil one or more particles of moisture

FIG. 4—SOIL WITH WATER AND AIR.

are lodged. These conditions are evidently favorable for the process of germination: warmth (the season being favorable), moisture and air, all coming in ready and undisturbed contact with the seed.

Under these conditions a physical change soon takes place by the presence of the moisture, causing the seed to expand. Heat is thereby generated, something in excess of that in the surrounding soil, which assists the elements of the air and moisture to exert into activity the vital principles—a chemical change at the same time taking place in the constitution of the seed.

The hidden, unseen, vital principle now commences to act, decomposing portions of the surrounding water and grasses, and appropriating or assimilating to the germ such particles of matter (plant food) which are needed to develop and further build up the now animated embryo. The substance which composes the larger portion of the seed (the *cotyledon*, heretofore described in these articles) furnishes food for the growing plant until the leaves and roots which it builds up are able to seek other sources of nourishment in the surrounding earth and air.

In our next we shall examine further into this miracle of growth.

VALUE OF NEWSPAPERS TO FARMERS.—Clark Bell, Esq., in a late agricultural address at Steuben county, New York, full of matter of immediate and practical interest to his hearers, among other things said: "No one can too highly estimate the value of a good newspaper in a family of children, and I am of the opinion that if one is taken constantly in a family, it will be impossible for the children to come up without becoming intelligent upon all the questions of the day. Every household should bring in the newspaper, then, as an absolute and indispensable necessity. I defy any farmer to try for a year, and then be able to say it has not paid, and been in every way for his good." Of course this refers only to such papers as are devoted to really useful and instructive reading.

SIX GOOD RULES FOR CATTLE MEN.—Never buy a low-bred animal; cheaply purchased is half sold; feed only with the best of food; feed regularly and cleanly; keep your animals warm and dry (this rule should be followed in California as well as elsewhere); sell as soon as fat.

Jottings in Santa Clara County.

Los Gatos is the name of a pleasant little village situated ten miles west of San José at the foot of the Santa Cruz range of mountains, on the Los Gatos creek. The situation is a little cone at the mouth of a picturesque cañon, half inclosed with hills and beautifully studded with noble trees, that struggle away in squads towards the open valley, or fringe the stream in wanton profusion. There are favorite picnic grounds in this vicinity. A large amount of wood and lumber finds its way from the mountains to San José through the village.

The Los Gatos Manufacturing Company owns a large stone flouring mill, that was built in 1856 at a cost of about \$100,000. It has five run of stones. They have also built a woolen mill that runs 240 spindles and 5 looms. The whole is run with water power. A substantial flume, one and a half miles long, built at a cost of \$10,000, carries the water to the iron pipes, where 60 feet of pressure drives two turbine wheels, a Leffel and Swain, to supply the power. To such as are interested to learn the relative cost and merits of these turbine wheels, it would be worth a visit to these works. Two tailoring establishments have been started in this place, that work up some of the honest cloth here made into substantial clothing. The San José Water Company takes the water from the mills just where it leaves the wheels. It is carried in an open flume three miles to a reservoir, and thence conveyed through iron pipes, laid underground, seven miles into the city, to sparkle in fountains and glasses, to lay the dust of the streets, to drive with steam the fiery engine, to enter in the thousand uses so grateful to man.

No Chinese labor is employed about any of these works; and it is extremely gratifying to find a growing desire among the enterprising, industrial interests, to encourage our own people in preference to that class of immigrants whose interests are in no way connected with ours, and whose education, desires and objects are wholly foreign; who simply invade this country to carry away the golden spoils.

S. H. HERRING.

Greasing Wagon Wheels.

The proper greasing of wagon wheels is of much more importance than generally supposed. The *Coachmakers' Magazine* gives some valuable information on the subject, which may not be generally known. We quote as follows: "Few people are aware that they do wagons, and carriages more injury by greasing too plentifully than in any other way. A well-made wheel will endure constant wear from ten to twenty-five years, if care is taken to use the right kind and proper amount of grease; but if this matter is not attended to, they will be used up in five or six years. Lard should never be used on a wagon, for it will penetrate the hub, and work its way out around the tenons of the spokes, and spoil the wheel. Tallow is the best lubricator for wooden axle-trees, and castor oil for iron. Just grease enough should be applied to the spindle of a wagon to give it a light coating; this is better than more, for the surplus put on will work out of the ends, and be forced by the shoulder bands and nut-washer into the hub around the outside of the boxes. To oil an iron axle-tree, first wipe the spindle clean with a cloth wet with spirits of turpentine, and then apply a few drops of castor oil near the shoulder and end. One teaspoonful is sufficient for the whole.

We would add that for journals on which there is a heavy pressure it is a good plan to mix with the oil some lampblack or common soot. Powdered plumbago or black lead is also employed for the same purpose."

Another writer in decrying some of the thoughtless acts of cruelty to animals says: "Some persons may not be aware that the trifling neglect of a pair of wheels being comparatively dry or well greased will cause twenty miles to take far more work out of a horse than forty would in the latter case; yet wheels absolutely screaming from dryness are often seen and heard attached to carts and wagons; and thus would the brute in human form let them scream until he had finished his journey's end or his day's work, though his horses were drawing, from such cause, at least one ton in four of resistance more than they would if the defect were attended to."

An Insectivorous Plant.

We give herewith a representation of one of the most remarkable plants known to botanists—*Dionaea Mucipula*, or Venus' Fly-trap. It is confined almost exclusively to bogs and marshy places about Wilmington, North Carolina. It belongs to a class commonly known as dew plants, from their having the appearance of being covered with dew.

In this species the leaf-stalks have two broad elongated wings, much larger than the leaf proper, which also consists of two lobes or wings, fringed with cilia (or hair-like appendages, similar to an eyelash). Near the center of each leaf are six small hairs, in which resides a peculiar sensitiveness hereinafter noticed. This description will be easily understood by referring to the engraving. The plant sends up a single flower-stalk, which bears a

cluster of flowers upon its summit, as shown. The mode in which the plant catches insects and consumes them is described as follows in the *Hearth and Home*, from which paper we also copy the accompanying engraving.

Whenever an insect attempts to crawl over the leaf, the leaf suddenly closes or shuts up, inclosing its prey in the manner of a steel trap, and the oil on the edge of the leaf, interlocking like the teeth of a trap, effectually prevents his escape. It has been supposed by some that the object of this arrangement was to supply the plant with nutrition, but this was doubted by some botanists, including Linnaeus; but lately the matter has been set at rest by the experiments of William M. Canby, Esq., an American botanist residing in North Carolina. Mr. Canby found that the glandular hairs secrete a fluid which dissolved the insect, and supposed that the fluid was then in some way conveyed to the roots of the plant, and then taken up for its nourishment. After going through this operation, the leaves would reopen and again catch insects; but each time they did so became less and less sensitive, and finally lost their irritability altogether. This induced him to try other substances.

He fed several leaves with pieces of raw beef, and at the end of ten or twelve days the beef (excepting some gristly pieces

purposely introduced for experiment) was entirely dissolved or digested by the fluid secreted by the glandular hairs, and was all absorbed by the leaves, which then began to reopen. A slight shower aided this curious digestive process, but too much water appeared to weaken the effect of the fluid secreted. To show that this is not the result of the decomposition of the animal matter, a planarian was noticed that had been caught by one of the leaves; he endeavored to eat his way through it, but, although alive, was very weak, being surrounded by the fluid, which was gradually killing him; this showed that the fluid was not secreted until after the prey was caught.

Mr. Canby tried cheese, another animal substance, but it was only partially digested, and finally killed the leaf, but without injuring the rest of the plant. A large centipede was destroyed and devoured by another leaf; but, generally, beetles and insects having hard-case wings, were rejected after a short time.

We have here a curious nut for our vegetarian friends to crack—namely: a carnivorous vegetable provided with the means of catching insects of various kinds, and then turning its leaves into a kind of stomach, furnished with a sort of gastric juice, and deliberately devouring them for its own nutrition.

This plant can be cultivated in small pots of peat-earth, covered with moss, and the pot placed in a saucer of water in a shaded part of the greenhouse. It should be kept continually moist, but never deluged with water. It can be increased by seeds or division of the roots; and the leaves, if placed on damp moss and covered with a bell-glass, will emit young plants from their edges.

Silk Business in Santa Cruz County.

While in Santa Cruz county I took occasion to visit the cocoonery of Mr. Jessie Williams, whose farm is seven miles north of Watsonville, in among the hills, some 600 feet above the sea level. The locality is sheltered from the prevailing winds and fogs, and seems to be very favorably situated for silkworms.

He has out three acres of trees, mostly the *Morus Multicaulis*, which he prefers where eggs are more of an object than silk. His trees are three years old, and he heads them very low, giving them a bushy form, with numerous shoots and limbs. He expects to get better leaves and more of them by this method of training. He thoroughly cultivates his land, which is of a light pliable loam, but does not irrigate. Indeed, he thinks the leaves much the best for feeding, when grown without irrigation.

Mr. W. is hatching 160,000 worms this year from four ounces of eggs. His trees will feed them. So far, he had not lost a worm, and they all appeared to be in perfect health. He had some hundreds of cocoons at the time of my visit, and worms in every stage of growth. His breeding-room is in a building by itself. He gives plenty of air, but does not allow a strong draft to strike the worms. He considers the even climate of the Santa Cruz mountains the best in the world for silkworms.

Mr. W. intends planting 5,000 more trees this year, and of building a cocoonery that will accommodate 2,000,000 worms.

He has already devoted much time and study and has had some up-hill experience in this business; but he is now sure of success, is deeply in earnest—is bound to succeed—and invites and offers to assist others to embark in the enterprise. He expects to produce 500 ounces of eggs this year—enough to make twenty millions of worms.

This place is well worth a visit from any one who has a desire to engage in the culture of silk.

Silk-growing is a branch of culture of which I have had no experience; but I am most favorably impressed with what I saw and learned at Santa Cruz. I can discover no reason why the business should fail of complete success.

Before reaching his place I inquired by the way, and was told it was not worth my

while going there. "Mr. W. was half crazy; had ruined himself, etc.—Could never make it pay. In short, silkworms were a humbug in this country. One good cow and a dozen chickens were worth more than all the silkworms in California!"

My opinion in the matter is this: One such "crazy man" as Jessie Williams is worth all the timid cow and chicken men in California, in every progressive sense of the word.

S. H. H.

What I Know of Farming—No. 24.

Fruit-trees—The Apple.

If I were asked to say what single aspect of our economic condition most strikingly and favorably distinguished the people of our Northern States from those of most, if not all, other countries which I have traversed, I would point at once to the fruit-trees which so generally diversify every little as well as larger farm throughout these States, and are quite commonly found even on the petty holdings of the poorer mechanics and workmen in every village, and in the suburbs and outskirts of every city. I can recall nothing like it abroad, save in two or three of the least mountainous and most fertile districts of Northern Switzerland. Italy has some approach to it in the venerable olive-trees which surround or flank many, perhaps most, of her farm-houses, upholding grapevines as ancient and nearly as large as themselves; but the average New England or Middle State homestead, with its ample apple orchard and its cluster of pear, cherry and plum trees surrounding its house and dotting or holding its garden, has an air of comfort and modest thrift which I have nowhere else seen fairly equaled. Upland Virginia and the mountainous portions of the States southward of her may in time surpass the most favored regions of the North in the abundance, variety and excellence of their fruits; for the peach and the grape find here a congenial climate, while they are grown with difficulty, where they can be grown at all, in the North; but up to this hour, I judge that our country north of the Potomac is better supplied with wholesome and palatable tree-fruits than any other portion of the earth's surface of equal or nearly equal area.

On the whole, I deem it a misfortune that our Northern States were so admirably adapted to the apple and kindred fruit-trees that our forefathers had little more to do than bury the seeds in the ground and wait a few years for the resulting fruit. The soil, formed of decayed trees and their foliage, thickly covered with the ashes of the primitive forest, was as genial as soil could be; while the remaining woods, which still covered seven-eighths of the country, shut out or softened the cold winds of winter and spring, rendering it less difficult, a century ago, to grow fine peaches in Southern New Hampshire than it is now in Southern New York. Devastating insects were precluded by those great, dense woods from diffusing themselves from orchard to orchard as they now do. Snow fell more heavily and lay longer than now, protecting the roots from heavy frosts, and keeping back buds and blossoms in spring, to the signal advantage of the husbandman. I estimate that my apple-trees would bear at least one-third more fruit if I could retard their blossoming a fortnight, so as to avoid the cold rains and cutting winds, often succeeded by frosts, which are apt to pay their unwelcome farewell visits just when my trees are in bloom or when the fruit is forming directly therefrom. Hence I say to every one who shall hereafter set an orchard, give it the northward slope of a hill if that be possible. Other things being equal, the orchard which blossoms latest will, in a series of years, yield most fruit, and will be most likely to bear when the apple crop of your vicinity proves a failure. I do not recommend storing ice to plant or bury under the trees in April, for that involves too much labor and expense; yet I have no doubt that even that has been and sometimes might be done with profit. In the average, however, I judge that it would not pay.

In locating and settling an orchard, the very first consideration is thorough drainage. Nothing short of a destructive fire can be more injurious to an apple-tree than compelling it to stand throughout winter and spring in sour stagnant water. Barrenness, dead branches, and premature general decay, are the natural and right consequences of such crying abuse. There are many reasons for choosing sloping or broken ground for an apple orchard, whereof comparative exemption from frost and natural facility of drainage are the most obvious. A level field, thoroughly

underdrained to-day, may, through neglect and the mischiefs wrought by burrowing animals, have become little better than a morass thirty years hence; but an orchard set on a tolerable steep hillside is reasonably secure against wet feet to the close of its natural life.

A gravelly or sandy loam is generally preferred for orchards; yet I have known them to flourish and bear generously on heavy clay. Whoever has a gravelly field will wisely prefer this for apples not merely to clay but to sand as well.

And, while many young orchards have doubtless been injured by immoderate application of rank, green manures, I doubt that any man has ever yet bestowed too much care and expense on the preparation of his ground for fruit-trees. Where ridges or plateaus of fast stone do not forbid, I would say, turn over the soil to a depth of at least fifteen inches with a large plow and a strong team; then lift and pulverize the subsoil to a depth of not less than nine inches; apply all the wood ashes you can get with one thousand bushels of manure if you are in a manure region; if not, use instead from thirty to fifty bushels of quicklime (oyster-shell, if that is to be had) with one hundred loads per acre of spamp muck which has lain a year on dry upland, haking in the sun and wind, and now you may think of setting your trees. If your soil was rich western prairie or Middle State garden to begin with, you can dispense with all these fertilizers; yet I doubt that there is an acre of western prairie that would not be improved by the lime or (perhaps better still) a smaller quantity of refuse salt from a packing-house or meat-retailing grocery. There are not many farms that would not repay the application of five bushels per acre of refuse salt at twenty-five cents per bushel.

Your trees once set—and he who sets twenty trees per day as they should be set, with each root in its natural position, and the earth pressed firmly around its trunk, but no higher than as it originally grew, is a faithful, efficient worker—I would cultivate the land (for the trees' sake), growing crops successively of ruta hagas, carrots, beets, and early potatoes, but no grain whatever, for six or seven years, disturbing the roots of the trees as little as may be, and guarding their trunks from tug, or trace, or whistle-tree, by three stakes set firmly in the ground about each tree, not so near it as to preclude constant cultivation with the hoe inside as well as outside of the stakes, so as to let no weed mature in the field. Apply from year to year well-rotted compost to the field in quantity sufficient fully to counterbalance the annual abstraction by your crops. Make it a law inflexible and relentless that no animal shall be let into this orchard to forage, or for any purpose whatever but to draw on manures, to till the soil, and to draw away the crops. Thus until the first blossoms begin to appear on the trees; then lay down to grass without grain, unless it be a crop of rye or oats to be cut and carried off for feed when not more than half grown, leaving the ground to the young grass. Let the grass be mowed for the next two or three years, and thenceforward devote it to the pasturage of swine, running over it with a scythe once or twice each summer to clear it of weeds, and taking out the swine a few days before beginning to gather the apples, but putting them back again the day after the harvest is completed. Let the swine be sufficiently numerous and hungry to eat every apple that falls within a few hours after it is dropped, and to insure their rooting out every grub or worm that burrows in the earth beneath the trees, ready to spring out and apply himself to mischief at the very season when you could best excuse his absence. I do not commend this as all, or nearly all, that should be done in resistance to the pest of insect ravage; but I begin with the hog as the orchardist's readiest, cheapest, most effective ally or servant in the warfare he is doomed unceasingly to wage against the spoilers of his heritage. I will indicate some further defensive energy in my next.—*Horace Greeley*.

THE GRAPE CROP.—The prospect of a large crop of grapes throughout the State is very encouraging. The demand for California wine in the Eastern States is increasing and prices have very materially advanced of late.

MAMMOTH CHERRIES.—They raise cherries in Alameda county that measure 3½ inches in circumference. Of a lot recently sent to this city, thirty-six of the largest weighed a pound—so says the *Bulletin*.

Notices to Correspondents.

J. M. W.—NICKEL.—This is last quoted at \$1.25 to \$1.50. We should like a description of the ore, as we are doubtful about its being nickel. The obtaining of nickel from its ores is a long and complicated process, which depends much on the nature of the ore. One way is to roast until the arsenic is expelled, then to melt with sulphur and potash, then to wash well and dissolve in acid, and from the solution to throw down iron, copper, etc. The nickel oxide may be thrown down with caustic potash (in an air-tight vessel) or the oxides may be precipitated by carbonate of soda or potash, treated with oxalic acid, washed, dissolved in ammonia and heated, whereby oxalate of nickel is precipitated. The nickel obtained must often be treated more than once if it is necessary to get it pure and free from cobalt. Some remarks on the ore will be found under the "Contributions to Our Cabinet."

FOSSIL TOOTH.—A description of a fossil tooth from Table Mountain, by Prof W. P. Blake, sent us by G. A. Treadwell, will be published at the earliest possible moment.

SILVER CITY, IDAHO.—Letters from our correspondent from this locality will be published in our next.

ANOTHER disastrous fire is reported. At Pittsburg, on the 28th ult., during a storm, a 20,000-barrel tank, filled with petroleum, was struck by lightning. The burning oil running towards the river set fire to other buildings and to a bridge. The loss is estimated at over half a million dollars. One life was lost.

FOURTH OF JULY.—The Committee on Literary Exercises for the Fourth of July celebration have selected W. H. L. Barnes as Orator of the day, Bishop Kip as Chaplain, and S. W. Piercy as reader of the Declaration of Independence.

Pushing Forward.

It is hardly necessary in commencing a new volume, as we do to-day, to remind our readers that we are constantly pushing forward in our efforts to improve the SCIENTIFIC PRESS. We have never relied upon promises of what we propose to do; but have always been able to point to what we have done in the past, as the best assurance of what is in store for the future.

At the opening of the present year we reduced the price of the paper from \$5 to \$4 per annum, believing that the modified condition of affairs on the Pacific slope, growing out of the opening of the Overland Railroad, and other facilities for more frequent intercourse with other portion of the world, fully warranted such a step. Our anticipations have been more than realized in the increase of subscriptions, so much so as to enable us to give an additional amount of reading matter by the presentation to our readers of a double-sheet the first issue of every month.

Illustrations.

We have also made such arrangements as are now enabling us to greatly increase the number, interest and variety of our illustrations. While this improved feature adds largely to the cost of publication, we feel confident the additional interest and value thereby given to our columns, will be duly appreciated by a discerning public.

The Miner, the Mechanic, the Inventor, the Farmer and the Naturalist, will all find something of constant and practical interest in this direction.

The Miner will always be presented with everything new in the way of reducing ores, whether by mill process or by smelting.

All important improvements in Machinery will be promptly presented to the Mechanic, while the Inventor will be as regularly furnished with hints and stepping stones upon which others have mounted, and from which he in turn will be able to see still further and more clearly into the undiscovered future.

The ideas and instructions that we are here constantly placing before the Farmer will speak for themselves. If the reader will pardon us for a mere hint at the future, we venture the promise that no one thing that is new and of any real practical importance in the mechanics of Agriculture shall be omitted in that portion of our illustrative department.

The Naturalist too will now and then find something to interest and instruct; while the general reader is never forgotten.

How far we have succeeded in making the SCIENTIFIC PRESS acceptable to the public, we can only judge by the words of hearty commendation which we are constantly receiving, not only from our brethren of the press, but from numerous private letters, from the readers with which our patrons pay up their annual subscription and from the rapid increase of our list of subscribers.

A reference to the index published in our last issue affords the best evidence of the wide field of research and instruction in which we are engaged. The present number affords ample evidence of the truth of what we have written, and to strangers our subscribers can fully attest that the present is but an average of our issues upon the first of each month.

The carefully digested mining summary which we give each week; the chronicles of scientific and mechanical progress; the large and varied information on agricultural matters, and the many matters of general and special interest, together with the numerous illustrations, in all the various departments, combine an amount of information which for value, interest and variety, will not suffer in comparison with any periodical of the day.

Mines at Baker City, Oregon.

Our correspondent, J. M. W., writes us, under date of June 19, concerning the mines of this city. The Rockefeller lode, of which much has been said, was discovered by accident. An express rider, by name Rockefeller, on his way home from Umatilla to Idaho, found his horse lame at this place, and on dismounting to look at the horse's foot, picked up a rock which proved to be a specimen of quartz containing an abundance of free gold. He made up a prospecting party and came back, and soon discovered a rich and well-defined quartz ledge. The first rock worked yielded \$150 to the ton in gold, and no attention was then paid to the silver glance (sulphuret) which the present owners, Brown & Co., now find quite abundant.

Messrs. Brown & Virtue have worked their ledge down some 300 feet to the water level, taking out ore enough to keep a ten-stamp mill running night and day. They are now preparing to erect a steam pump for the purpose of freeing the mine of water. Our correspondent visited the place in company with Mr. Virtue. The greater part of the remainder of his communication we give in his own words.

The width of the ledge at the present depth is two feet and the ledge is as well-defined (between the walls of porphyry?) mixed with slate) as I ever saw. The rock that has been taken out recently averaged \$35 to the ton of free gold, and the sulphurets have assayed \$150 per ton. They now employ ten men. Their mill is eleven miles from the mine on East Powder river, which stream contains water-power enough to run fifty mills, such as the Rockefeller. It is surprising to me that more rich ledges have not been struck in the vicinity of Baker, for the placers are very rich and much quartz has been found in the placer mines that was rich with free gold. It is my impression, however, that, as the country becomes more developed, many rich veins of both gold and silver will be found in this county. In the placer mines in the claim of Caldwell & Co., at Gimletville, they found a few weeks ago a nugget valued at \$3,990. A claim at Eagle creek, in the same county, run forty-two days and cleaned up \$4,200. A Chicago company are now negotiating to buy what is known as the Burnt River ditch, and propose enlarging it so as to supply steady water to the El Dorado and Amelia City and other rich districts. The scarcity of water only prevents the mines in this locality from giving surprising proofs of their richness, and if they were 4,000 miles away, there would be a grand rush to them. There have been shipped from Baker City, during the month of May last, \$150,000 and upwards of bullion, and for the year ending June 1st, 1870, over \$450,000. At least \$150,000 has left this place in private hands during this time. A great drawback to traders in Eastern Oregon is the scarcity of coin, and the very high rates that are charged in making the exchange. My old friend, Capt. Fisk, is engaged in the assaying business in Baker, and he informs me that it costs from three to four per cent. to get coin from your city. The Capt. has promised to keep you posted on this section of the country, and for fear I should make this letter too long and tedious to you, and deprive the Capt. of some of his intended items, I will bring it to a close by saying that I was well pleased with everything in Eastern Oregon.

EXPEDITION TO BRAZIL.—On June 23d two professors and ten students of Cornell University sailed for Brazil, where they intend spending six months in scientific explorations. Prof. C. F. Hart, who was with Agassiz, if we mistake not, is in charge of the expedition.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING JUNE 21ST.

INSTRUMENT FOR REMOVING TWINE AND WIRE FROM BOTTLES.—John T. Haviland, San Francisco.
GRAIN-LIFTER AND HARVESTER.—William M. Jackson, Woodland, Cal.
CHILD'S CHAIR.—Abraham Henry Wehser, San Francisco.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

DOVE-TAILING MACHINE.—E. Heath, S. F.—This is a simplified arrangement for forming the dove-tail joints of drawers and boxes, and consists of two sliding frames, moving on tables, one of which serves to dove-tail the end, and the other the side piece of a box, without the use of swinging guides, numerous gauges and beveled tables. The saws for the two frames can be fastened to the same mandrel or to separate mandrels. The two tables, moreover, may stand side by side, or may be separated, and may be used for all ordinary purposes of sawing by simply removing the sliding frames. The sliding frame for the side pieces has a tapering guide fastened to one of the cross beams, so as to give the desired angle to the tenon, the board standing upon this guide, while the frame slides at right angles with the saw mandrel. The end pieces are formed on a similar sliding frame on the other table, but the guides in this case stand at an angle with the mandrel. The construction renders it possible not only to use the tables for common sawing, but also to fit up any plain sawing table with the device at a small expense, while it does away with all sawing guides, which soon get loose and out of order, and necessitate two sets of gauges and the resetting of the guide for each side of the dove-tail. When the table is fitted up especially for this work, a large number of saws and cutters may be used, so that all the dove-tails of any box can be cut at once by two motions of each frame, leaving nothing more to be done except to fit them together. The tables may be hinged at one end, and the opposite end raised and lowered by screws, to regulate the depth of the mortices and tenons.

PAINTING PHOTOGRAPHS IN OIL AND WATER COLORS.—R. Winter, S. F.—The object of this invention is the production of a new and improved style of painting upon photographic pictures, or cards upon which a photograph has been taken. Coloring photographs is quite popular, and hence it is very desirable to use some method by which the coloring matter can be laid on without producing a harsh or unnatural effect. The inventor claims that, by his method, he produces a brilliancy, softness and clearness of outline which cannot be obtained in photographs as ordinarily painted. Certainly his productions are very artistic efforts. Possessing all the fidelity of the photographic outlines, and, in addition, having the colors laid on in the softest and most natural manner, the pictures compare most favorably with the choicest of oil paintings. Those who have seen the photographs are unanimous in their praise, and we hear the most favorable criticisms from all sides.

MILL FOR JAPAN.—We have previously alluded to the concessions made to foreigners, with regard to the mines, by the Japanese Government, and to the mining prospects there. We find now that the Pacific Iron Works of this city are manufacturing a 10-stamp mill, with pans, settlers, etc., and engine and boiler complete, for "government use" in Japan. We could not learn the locality for which the mill is intended. It is ordered for working both gold and silver ores.

Improved Floor for Stalls.

It is a matter of economy, as well as of humanity, to have the stalls for cattle as clean and neat as possible. But too often through poor construction and neglect the stable is a most disagreeable place. The liquid and refuse matter are allowed to remain, or only imperfectly removed; and thus what might be made a valuable means of enriching the soil is left to become a disagreeable and unwholesome object.

To assist in making the stable what it should be, is the object of the device here illustrated. In this the floor of the stall is a wooden grating, B, which is hinged at one end, C, so that it is easy to raise it when necessary, by means of cords and pulleys, as is shown sufficiently plainly in the engraving. The bars in these gratings are placed a quarter of an inch apart, so that the calks of the horse's shoes cannot catch between them, and but little dirt can fall through. They are arranged so that any one can be raised, independently of the others, by means of a small hook provided for the purpose. And as their ends are slotted, as shown at C, they can be entirely removed when desired.

Under the stalls are the gutters, A. Those on the lower floor have a lining of cement, and those on the upper story are of wood lined with zinc or any other suitable waterproof material, which may also be used for covering the beams. Thus the stalls can easily be kept clean, and may be thoroughly washed out by means of hose whenever it is needed. The gratings can be inclined at any required angle, and when the middle bars are worn they may be changed with those at the sides, so that the floors will last a great length of time when made of good timber.

A patent for this device was obtained June 8th, 1869, by William M. Beakley, of Verplanck, New York, who may be addressed for State and county rights.

A NEW ENTERPRISE.—The *Call* says that a San Francisco party has bought a tract of swamp land in Alameda county, with the view of utilizing the same by stocking it with terrapins. Of course we suppose frogs will be raised as food for the terrapins, and incidentally, also, for the supply of the growing market for that delicacy in this city. The proprietor congratulates himself upon the fact that drouth will never affect his crops; neither will his pets get the pip, and die off as the chickens do on the dry ranches.

We see no reason why terrapin and frog-culture may not, to a limited extent at least, prove equally as remunerative as fish-culture. Neither require much attention or capital, while the increase is enormous. It has been fully demonstrated that one acre of water can be made to produce more valuable food than two or three acres of land. "Swamp and overflowed land" may yet be shown to have a value for other purposes than "reclamation."

IRON PIPES, when laid in the ground, and packed all around with dry clay, do not rust, or at least, their oxidation is very slow. The clay protects the metal from the action of oxygen in moisture and air.

UTILIZATION OF IRON SLAG.—Mr. Joseph Woodward has taken out a patent in England for converting the millions of tons of slag from the blast furnaces into building brick.

Our Home Industries.

Sawing and Planing Mills.

It sounds strange to the Eastern visitor to hear the Californian continually announcing his intention to return "home" at some future time. How many there are on our coast who seem to consider this country as merely a temporary place of residence, good for making money in, but to be abandoned as soon as sufficient wealth has been acquired. A Californian, as some one has said, seems to have no home. "He builds his house on pegs, and the chickens run around under it, and now and then

worth about \$60; and then more or less of Spanish cedar, laurel, cherry, walnut, mahogany, etc.

The newest, and certainly one of the largest and best, of our city mills is the Enterprise, on Spear and Stuart streets, between Howard and Folsom. This is owned by D. A. Macdonald & Co., an old California firm, which has been engaged in the business many years. But this spring they determined to give up their old location, on the corner of Beale and Market streets, and about the first of May they had finished and commenced running their new establishment, which we have visited lately.

BEAKLEY'S PATENT IMPROVED STALL FLOOR.

he puts it on wheels, and trundles it to some other locality."

This is still true to a great extent now, but not so much so as formerly, and it will not be equally applicable in the future. We are beginning to acknowledge the fact that the better policy is to build up comfortable nests here. Our children will regard this country as their home, and will not apply that term to the East.

An evidence of the growing determination to abide in this land, is the greater amount of attention and money expended on the fitting up of buildings. Every year the number of handsome residences is increasing, and the manufacture of the various articles of wood-work for houses is already an important branch of our home industries.

Under the head of "Sawing and Planing" in the S. F. Directory for 1870, we find twelve names given. Five of these, the California, the Mechanics, the Empire, the South Point, and the Enterprise mills, do a large business. The work turned out amounts in value to between one and a-half and two millions dollars (at a rough estimate) yearly, and many thousands of feet of lumber are used every month. Of this last, the greater portion is Redwood, worth now about \$30 per thousand. Then comes Sugar Pine, worth \$55 to \$60; then Cedar,

machine, five sticking machines, two shaping machines, and six sash and blind machines.

On one side of the lumber yard is the engine house, a fire-proof brick building, with iron doors. The engine is one hundred horse power and, with the boilers, was made at the Risdon Iron Works. The shafting came from the Vulcan Works. The main shaft is sixty-five feet long, and the main belt one hundred and twenty feet long and twenty-four inches wide. The fuel used consists of the shavings from the mill, and this forms an economical feature in the construction, worthy of note.

The rear part of the building, on Stuart street, has been let to a firm, who do the turning and glazing for the concern, while up stairs is the carving and stair-building department. Macdonald & Co. own the adjoining lot on the east of their mill, so that at some future time they can extend their works, if necessary.

To describe in detail the various operations to which the lumber is subjected to shape it into boards, into sashes, blinds, mouldings and scroll-work of every description, would demand too great a portion of our paper. It is most interesting, however, to see the working of the different machines, and how quickly a rough piece of wood is transformed into some shapely device. The variety, and quick and neat operations of the various machines bear testimony, in the highest degree, to the inventive talent of our age.

In this establishment some eighty men are employed, and, on an average, at least 300,000 feet of lumber are worked up monthly. The firm—which is composed of the following gentlemen: D. A. Macdonald, Jos. McGill, J. H. Macdonald and Howard Chapman—has furnished many public and private buildings with wood-work, and the last figures show that their business must be very extensive.

ARTIFICIAL HONEY and much of the syrups used by brewers in the manufacture of spirits is derived from damaged wheat, corn and rice, and from potatoes. When such substances begin to decay the nitrogenous principle is the first to be destroyed, while the starch, which forms the chief portion of their

substance, is more permanent, and, if promptly taken in hand, may be saved. By chemical manipulation this starch is converted into glucose or grape sugar, which, after proper flavoring, is subsequently sold for honey or syrup, and in the latter condition employed by the distiller. Nearly all the liquid honey sold at the East, and, no doubt, much in this State, is thus manufactured. Old honey-comb is also sometimes nicely filled with this substance, and sold as the genuine product of the bee. The gum employed for labels and envelopes is made from this glucose—hence its sweet taste. There is nothing especially bad about such sweets, other than the deceit practiced in palming them off for something else than what they really are.

OVERLAND PASSENGER TRAFFIC.—The through passengers to this State from the East, overland, during the first five months of 1870 numbered 13,170; through passengers the other way, 7,831—or a gain for California, by the railroad, of over 1,000 a month. The arrivals by sea for the same time was 10,214; departures, 4,751—a still larger gain than that by railroad.

EXCELLENT kid gloves are now retailed in Paris at two cents a pair.

Notes on Contributions to Our Cabinet.*

ORES FROM COPE DISTRICT.—We have received a number of specimens (Nos. 457 to 462) from this district, forwarded by our correspondent, W. H. M., whose interesting letter from Mountain City is continued in this issue. These specimens however, were loosely packed, and consequently were considerably broken on the way. Moreover, the labels were so torn that only a few were decipherable. Those which we could make out, we have numbered separately. The others are comprised under No. 457. This fact will explain also why we mention but one name in this connection.

No. 457.—The general character of the ore is of finely-divided minerals, disseminated through a quartz gangue. These minerals are generally of so small a size that they are with difficulty decipherable. Evidently we have been sent working specimens and not show pieces, or else the transport has destroyed the crystal specimens. The ore is evidently very rich, and there is an abundance of horn silver. There are also some fine specimens of native silver. Silver glance (sulphuret) occurs in varying amounts. There are, moreover, small amounts of galena, iron and copper pyrites, zinc-blende (in one or two instances) and some feldspar, with iron and copper etains. These remarks apply in general to the following from the district.

No. 458.—Argenta mine. The rock is partly decomposed, containing considerable feldspar. One specimen contains a very large amount of horn-silver. The other specimen has evidently been subjected to artificial heat, and shows numerous globules of metallic silver.

No. 459.—Great Eastern mine. Here the copper stains and the fine crystals of galena, iron and copper pyrites and zinc-blende occur plainly, but in small amounts.

No. 460.—Belle of the West. Presented by C. H. Massie. Considerable feldspar occurs in this specimen.

No. 461.—Monitor mine. Considerable copper and iron stains, and some galena. In one or two places there are some minute green minerals, which are not plain enough, however, to be deciphered.

No. 462.—Idaho Extension. With zinc-blende and pyrites.

From the appearance of the above specimens, we are inclined to believe that a good mine in Cope district must be an exceedingly valuable property. Thanks to the donors.

No. 463.—Very fine specimens of native gold with iron pyrites in quartz and calc- spar. These specimens are very rich and handsome. They came in a small oval wooden box. Who is our unknown friend?

No. 464.—Sample of grindstone from the quarry of Thomas Robinson, Vallejo Mills, Alameda county. A grindstone of this quality was exhibited at the Sixth Industrial Exhibition of the Mechanics' Institute, and a diploma was awarded therefor. The committee say in their report:

The stone is of altered cretaceous formation, is of fine grain, even gray color and texture, free from quartz veins or other defects, and is the best freestone yet found in California for the purpose to which it is at present applied. In grit it is of good quality. This grindstone is evenly and truly balanced and very well wrought, and fully equal in every particular to the best imported stones used for similar purposes to which this is applicable. Mr. Robinson is fully entitled to a diploma. As a building stone it is second to none on this coast. This we practically endorse. Awarded a diploma.

No. 465.—Magnetic pyrites, containing nickel, from Fenushyttan, Nora, Sweden. Presented by Mr. E. Andersen, who informs us that this variety of mineral is found in abundance in the locality given above, in the mines which have been worked for iron ore. Nickeliferous varie-

ties have been found in Norway, Sweden and in Pennsylvania. It is from these that most of the nickel of commerce is prepared. At the Camden Nickel Works, N. J., ore from the Gap mines in Lancashire county, Pennsylvania, is mostly used with some nickel-holding pyrite and millerite (sulphide of nickel). The whole amount of pure nickel produced in this country before 1864 was not over 100,000 pounds. Now these works turn out at the rate of 150,000 pounds yearly.

* Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

Ribbon Manufacture in Alameda County.

The Oakland Transcript says that arrangements are being made to establish a ribbon manufactory at San Leandro. We are glad to learn that such an enterprise is in contemplation. In order to give permanency to the business of raising silkworms, and

DERR'S CAPSTAN FOR ELEVATING HAY FORKS.

to make it profitable, the production of the silk itself, by reeling, and the conversion of the same into threads, ribbons and other manufactured goods, must be gradually introduced. In no other way can the silk business rise to any considerable importance in this State.

We do not know how much truth there may be in this reported project for establishing a silk manufactory across the Bay; but there certainly cannot be any serious difficulty in the way. We have an abundance of capital, and any amount of skilled labor can be obtained, by proper effort, either from the Atlantic States, from Europe or from Japan. The protection afforded by our present tariff, and the production of the silk from our own soil, will more than counterbalance the difference in the cost of labor between this country and Europe.

Sewing silk, ribbons and silk dress goods generally of every description, are now manufactured in the Atlantic States in large quantities. Silk manufacture is no longer an experiment there. It is as thoroughly and permanently established as are the manufactures of woollens or cottons. We can feed workmen here cheaper than they can be fed in the Atlantic States, and we have the added advantages here of being able to raise our own raw silk and a climate in which neither the drawbacks and disadvantages of long and cold winters nor the enervating effect of hot summers are ever encountered. We hope to see the project at San Leandro carried out and followed by others of a similar character.

An English tailor has invented a pair of trousers with wheels at the end. The experiments are said to give the speed of a horse and the power of instantaneously stopping. It is supposed that for such trousers he demands pay in advance.

Capstan for Elevating Hay Forks.

Mr. Derr, of Ohio, sends us an illustration of a device of his, which he thinks will be of great interest to our farmers. By means of this, he says, twice as much hay can be unloaded in a given time as by the old plan, and, moreover, one man is spared. And it can be used for driving any light machinery, such as feed-cutters, corn-shellers, etc.

A light horse-power is constructed with a spool or capstan working free on the tumbling shaft. One end of a rope is fastened to any horse hay-fork, passed over pulleys in the ordinary way, and the other end is attached to the spool. The horse is kept continually in motion, and when the fork has been placed in the hay, it is raised by a person standing on the load, who pulls a rope which passes around a pulley at C, and is attached to the end of a lever, B, which throws the spool in or out of gear by means of a clutch, A, as is easily seen from the cut. The hay having been thrown from the fork, the gearing rope is loosed,

permitting a spring to throw the lever back, and thus ungear the spool, and the weight of the fork reversing the action of the spool, is brought at once to the load.

It will be observed that no time is lost reversing the fork. In the old way of backing the horse the whole length of the rope to re-load, considerable time was consumed, and it was necessary to have a man to attend specially to the horse.

The end of the shaft, D, is constructed so that it can be coupled to any other shaft when the device is used for driving other machinery.

A patent was granted for this invention, August 10, 1869, to William Derr, of Seneca county, Ohio, whom address for State or territorial rights.

A NEW USE FOR THE PUMPKIN.—The English Gardener's Magazine suggests a new use for the pumpkin, or rather the pumpkin vine. It is—to use the tender shoots as greens. It is recommended that the growth of the plants be well established before cutting is commenced, and that all the young fruit be removed as fast as it sets. "Cook and serve in the same manner as for turnip or other greens. The brilliant green color, delicate aroma, and grateful flavor of the pumpkin-tops, when properly cooked," says the Monthly, "will commend them to the nicest epicure."

At a late meeting of the Geographical Society in Vienna, a resolution was adopted recommending the sending of an Austrian expedition to the South Polar Sea in 1874, to make observations of the transit of Venus. It has been calculated that the most favorable point from which to witness the appearance and disappearance of the planet is in 53° latitude and 12° longitude east from Greenwich, or in the neighborhood of McDonald's Inlet.

Lectures to Workingmen.

A paper on this subject in a former number of *Nature* contains much of interest both to lecturers and to their audience. The following is worthy of place here:

I am not here expressing any opinion as to the rights and wrongs of many things at which workmen aim, and in which they engage. But totally irrespective of opinion, it is evident that there are many important questions the management and the decision of which are in the hands of the workingmen, and a right view of the respective importance of facts and of argument is the only safeguard against being misled. It is just at this very point that scientific teaching helps to make men right. I am not saying whether or not I believe that science is to be the regenerator of mankind. But this is certain, that there is a great benefit to be gained from scientific teaching, that it supplies to workingmen that which as a class they are deficient in, and that which as a class they are desirous of having; and that here there is open before all who care for these matters a wide field of direct and immediate utility.

I have seen 600 men, on a tempestuous winter evening, come to a lecture on astronomy at one of our great workshops in the North. It is a wonderful sight to see so many faces intelligent and seeking for knowledge. Workingmen are a peculiar audience; they are rather fond of cheering; and I have often had to check a piece of applause arising just before the conclusion of a demonstration which was tying together, so to speak, in a knot, several threads of argument. Such applause, coming, as I have so often seen it, just before the completion of an argument, indicates the satisfaction which all feel, and which these men are unsophisticated enough to express, when there just begins to dawn upon them the feeling of seeing, without being told, what some things have got to do with one another; the feeling, in fact, of making a discovery. And I can fancy nothing more encouraging to a lecturer who loves his subject than such facts, and nothing which more bears out the assertion that I have made, that there is among workingmen a true desire for, and a true appreciation of, something genuine in science. Workingmen—at least those with whom I am acquainted—have a strong perception of right and wrong, a strong moral character, a clear and open way of giving everything a fair hearing—that natural honesty which is the backbone of a nation.

STOUT-HEARTED LITTLE SACRAMENTO.—When I beheld the magnificent train of coaches, from the East come out of those snow-capped mountains yonder, and thunder loudly down across these plains, then I lift my mental hat to Sacramento. Stout-hearted little Sacramento!—that was not dismayed by the wasting fire and the flood; that was not dismayed or turned back from her large enterprise by the hootings and the jeers of small souls. Well might her citizens, when they had scaled, angle-headed, the summit of the Sierra, look down with a little triumph upon a dim and dismal spot by the sea, where these owls bopped up and down and croaked on their sand-spits around the Bay, until they got their eyes yellow in the fog, and couldn't see out even as far as the Farallones. One thinks of Emerson's lordly doggerel: "Gods! I will not be an owl; but sun me in the Capitol." I like the people of Sacramento, if for no other reason, because they are not always boasting of their weather, as the people of San Francisco do—even when they are stuffd so full of fog and sand that their voices seem to issue from under a bed-tick.—*Overland Monthly*.

TRAINING HEDGES.—In training hedges it is very important that the hedge should be cut with sloping sides, so that the light and air may more readily penetrate to its center. A hedge with a square top and perpendicular sides can never be kept thick at the bottom. The pruning, as a general thing, should be done just after the young growth has pushed out; although, in forest trees of naturally large growth, this operation should be somewhat longer delayed, or until summer has well set in, else such trees cannot be kept down. Severe summer pruning will keep the strongest and largest class of trees in a dwarfed condition for several years at least, and, in most cases, continually. Pruning is, to some extent, equivalent to cutting back the roots, as roots will not increase much out of proportion with the branches.

Chinese Deer.

Two of the animals here portrayed are now in the Zoological Society's Museum at London, England. The *Rural New Yorker* says that in 1865, M. Armand David, a French missionary at Peking, discovered the existence in the Imperial parks, near the Chinese capital, of a strange species of deer, and informed certain French authorities of the fact. A year later he sent to France skins and parts of skeletons of these singular beasts. In the spring of 1869, through the British Ambassador to China, the Zoological Society made application to Prince Kung for leave to obtain

The Timber of California.

BY J. RICHARDS M. E.

"To learn your own country, go to another," is a maxim as true as any ever uttered. An American who has in the last year been in England, or on the Continent, has no doubt heard more of our Pacific coast, and learned more facts that bear upon its future, than he would learn in the eastern portion of the United States in a decade. Ross Browne's "Mineral Resources of the Pacific Slope" would no doubt be found with less trouble in Paris or London than in Philadelphia or New York. It is true that European attention

with gunpowder in order to manufacture them?" Considering the heavy timber growth of California, perhaps the question is not so ridiculous after all. Our sawing machinery now in use in the Atlantic and Middle States is totally inadequate for the purpose. Reciprocating saws can, of course, only work on timber where its depth does not much exceed the stroke. Circular saws must increase in thickness as their diameter, and will, aside from other objections, waste too much stuff in the kerf. But lo! "another saw has risen"—one that offers at once a solution of the whole problem. The band saw will, with a thin blade, cut through even the giants of the Yosemite valley.

The band saw has in Europe been extensively and successfully applied to lumber cutting. It has in the Atlantic States

railway carriage wheels,—in England the discs or plates made from hard wood being now extensively used. Painted wood is the best and most healthy material for the interior of our dwellings, filling each and every condition with that nicety that proves the ample provisions of Nature for our wants, when we acquire the wisdom to discern them.

Lumber manufacture on the Pacific coast will no doubt attain an importance that it has in no other part of the world. This vast country must be studded with thousands of dwellings, not built, as in the Eastern States, throughout the course of two centuries; but in a few years—within the span of life of those now living—the vast country will, in all probability, teem with a population of twenty millions of souls. Her agriculture and manufactures

CHINESE DEER IN THE ZOOLOGICAL SOCIETY'S MUSEUM, LONDON, ENGLAND.

living specimens from the royal parks, and the young pair illustrated were shipped from Shanghai in April, reaching London in August of the same year.

These deer are called by the Chinese "Milon," or more often "Sse-pou-siang," the latter meaning "not one of the four," because of a fancy that they resemble the stag in their horns, the cow in their feet, the esmel in their neck, and the ass in their tail, and yet are different from all of them. The long tail and large ungainly feet render them at once distinguishable from the ordinary deer. The horns of the male in the pair shown are not yet developed, and the third one is pictured as fully matured, to show the full growth of the antlers.

Books.—It is stated that in 1863 there were published in the United States 1,450 original American works, 359 reprints of English books, and 109 translations and reprints of continental publications; total number, 1,918. They are classified as follows: Theology, 264; Fiction, 310; History, 174; Poetry, 127; Law, 108; Art, Sciences, 116; Year Books, 134; Medicine, 101; Travel, 91; Trade, 41; Education, 71; Juvenile Books, 235; and 155 miscellaneous.

has been directed to this matter from possible or probable Asiatic emigration that may indirectly have an influence on the "trade to the East," that has built up the national wealth of England, and augmented that of France, Germany and other Continental powers. But granting that this has directed attention to our Pacific coast, by calling out those learned and philosophical papers on emigration, by English savans, it is not to Asiatic emigration, even as a secondary condition, that this great interest in American affairs is ascribed. It is to the great rivalry in manufactures and manufacturing resources that this wonderful country will in future present. It does not require a great stretch of imagination on the part of the people of Europe to see a time when the metals and manufactured wares of the Pacific slope will meet them in Constantinople and Cairo, if not in Calcutta, while the trade of Japan and China will, through the reciprocal feeling growing out of emigration, revert to our Pacific slope.

This is, however, foreign to the subject that heads this article. In speaking of the timber growth of California to lumbermen in the Atlantic States, or abroad, the first question is, "What can you do with it? Your pines are too large to be sawed; how can you use them? You must blast them

been demonstrated as the best means (to say nothing of its great economy) for cutting the hard woods of Central and South America, which are imported in the log. There is scarcely a limit to the depth through which a hand-saw blade will cut; and as the speed of performance of any saw is as the speed of the teeth, we have in these two propositions the index to its capacity: a thin blade moving from 2,000 to 4,000 feet per minute square through the timber. The first cost of the saw is proportionately less than that of any other, and the mechanism to operate it consists only of a pair of wheels mounted on suitable supports, with the saw-guiding devices. Carriages, of course, can be constructed upon general plans, that will carry timber of any size, requiring no especial feature except increased strength and proportions. With practical means of deep sawing, the cost of manufacturing lumber will be reduced, as the size of the timber increases, and give to California an advantage which it has pleased Nature to bestow upon her, in her having heavy timber growth.

Wood and other metals are inseparable in manufactures, they must keep together. The elasticity and peculiar nature of wood as a material in construction, it is fair to presume, will not, in the future, be supplanted by another. For thousands of years it has held its place as a building material, as the only kind of framing that will stand in land carriages; and in some cases, where it has been supplanted by iron, it has returned to assert its superiority. An instance in point is in the manufacture of

will demand a rapid and economical conversion of her timber into lumber. Let us hope, then, that the band-saw has its mission here, and will be found equal to and adapted to the momentous work which we have mapped out for it on the Pacific slope.

A CALIFORNIA EVERGREEN is exciting considerable interest among horticulturists in England. The *Gardeners' Chronicle* says the original was sent from California. It is known as the "Samson cypress." The parent plant is about nine feet high and three through the thickest portion of the foliage. The *Chronicle* closes its remarks upon it as follows: "In the symmetrical outline of the tree itself, in the regularly radiating vertical ramifications, in the slender, graceful character of the everywhere erect spray, there is about this plant an air of refinement rarely met with, and which, combined with its bright and enduring verdure, stamps it as a gem of the first order among hardy evergreens."

GAS AND HEALTH.—Those who are compelled to work much by gas-light should have a care that the room they occupy is well ventilated. The necessity for this may be inferred from the fact that two common gas-jets will consume as much air as three men will require; hence, it is not surprising that so many operators who are compelled to work late at night by gas-light become feeble and sickly.

Kustel on Roasting of Ores.

[COPYRIGHTED.]

Of the various processes to which ores are subjected, the most important and difficult, especially in a financial point of view, is the roasting. It is in this process, in many cases, that all the profits are eaten up; hence, the operation deserves a large share of attention. From Mr. Kustel's book (now in press) on the "Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver," we make the following extracts:

FIG. 3—SMALL ROASTING FURNACE, GROUND PLAN.

with regard to roasting furnaces. These extracts are not taken continuously, but from several places. Thus we take the introductory remarks on the roasting furnaces, and then the description of the long furnace, which has been used with great success. Of Stetefeldt's furnace (among others) there is an excellent description, with illustration, which, however, we omit, as we have spoken of it lately and have not space for everything. The long furnace, however, has not before figured in the papers. Mr. Kustel, we may remark, devotes considerable space to the subject of roasting processes and apparatus.

Roasting not only requires much care,

rine to the ore, and this only through the chlorination period. During two or three hours of each charge, when desulphurization and sulphatization are going on, this must be performed by the oxygen of the air, while, if chlorides were present from the beginning, sulphurets, sulphates and oxides would have been partly decomposed directly by the chlorine, whereby time and a certain percentage of salt are saved.

In this respect a great advantage is gained by the introduction of "long furnaces," in which a continual formation of chlorides on the finishing hearth, near the bridge, is going on, volatile chlorides and free chlorine being evolved, which, on their way to the fire, are constantly in contact with the ore for a space of thirty to fifty feet in length. These furnaces show a great economy in fuel, labor and salt, and the roasted ore contains a better percentage of chloride of silver.

Another most important improvement in the way of chloridizing roasting is found in the Stetefeldt furnace, where all ore particles are involved in chloridizing gases under very favorable circumstances. The roasting is cheap, and from twenty to twenty-five tons of ore are roasted in twenty-four hours—more than ever accomplished in any other furnace.

Long Roasting Furnaces.—This kind of roasting furnace, as represented by Fig. 6 in cross section, and Fig. 7 in ground plan, gives much satisfaction, as there is not only a great saving of fuel effected, but also a greater quantity of ore can be roasted in a given time than with a single furnace. It is only a modification of the double furnace, but it seems to be more convenient for the roasters. The heat is better utilized, as the flame has not to pass flues between the hearths and is not broken so often; but the moving of ore from one

space between the roof and hearth of the other two. The ore is fed in the last hearth through the sheet-iron funnel *a*, spread equally on *b*, and, according to its drawings or the quantity of sulphurets contained, stirred more or less for one and a half to two hours. As it is not only inconvenient, but impossible to have a good stirring effected at a distance of twelve feet, which requires long and heavy tools, there are for this reason working doors on both sides of the furnace. The roaster uses hoes or rakes, eight feet long, made partly of gas pipe, which are light and handy. The working doors are thirty inches wide. They must all be kept closed except when the ore is being raked, and then it is very proper to have half of the door closed (with a piece of sheet iron). Sufficient air comes in at the working door of the first hearth.

After one and a half to two hours the ore is being raked, and then it is very proper to have half of the door closed (with a piece of sheet iron). Sufficient air comes in at the working door of the first hearth.

furnace of a similar description is in operation in La Dura, (Mexico) roasting refractory silver ores for the chlorination process.

A furnace 60 feet in length with six hearths, as built by Mr. Graff, at San Marcial, has the advantage of being capable of roasting from eight and a half to twelve tons of ore in twenty-four hours, discharging every hour from 700 to 1,000 pounds according to the charge. In case ore is subjected to roasting, which has not enough sulphur to create the required heat in burning, an additional smaller fire-place must be attached on one side, so as to bring the flame into the fourth hearth.

Mexican Mines.

Mexico is probably the richest mineral country in the world, and its riches are by no means worked out as yet. We have previously noticed a work on the "Min-

FIG. 6.—LONG ROASTING FURNACE, CROSS SECTION.

duced on *b*, *b'*. The second hearth has a greater heat than the third one, the ore is treated here as before, being raked as often as possible. After a lapse of one and a half to two hours the ore is moved again to the first hearth, in the same way as before, that is from *c* to *d'* and from *c'* to *d*. The ore is now exposed to a light red heat by which the chlorination or oxidation must be finished in the same time as on the other hearth. It is necessary to change here the ore from the bridge towards the flue, and reverse, once during the roasting. When ready, the roasted ore is drawn into iron cars below the furnace through the opening, *e*. When all the ore has been removed, the charge on the second hearth is transferred to the first, from the third to the second and from the funnel to the third hearth, and the process continued as before, so that a thousand pounds are drawn out every one and a half or two hours.

The bridge, *f*, is fourteen inches high.

eral Resources of Mexico" by Mr. C. Chipman, which contains much of interest. "If one half of the known silver lodes," says that gentleman, "were worked as they should be, by modern machinery and the skill which science and practice impart, the product of silver and gold alone would reach \$1,000,000,000 annually, and would employ in various ways ten million people." The figure seems large, but he adduces facts to support them. Baron von Humboldt estimates the total yield of precious metals by Mexico at \$4,218,243,840, from its discovery to the commencement of this century. The Veta Madre vein alone has yielded silver to the value of \$225,000,000, and although traced for many miles, has been worked only for a length of about one

FIG. 4.—SMALL ROASTING FURNACE, CROSS SECTION.

but it is also an expensive operation. For this reason the choice of the right kind of furnaces is of very great importance, and so much more as a perfect and economical extraction of silver depends principally on the result of roasting. The chloridizing roasting is known to be the most suitable way for the subsequent extraction of silver in whatever way it may be performed, by amalgamation or solving; consequently those furnaces in which the ore particles are exposed to the action of chlorine and other chloridizing gases to the most advantage, must be considered the best. The old style of furnace was four to six feet wide and ten feet long, and in them a small part of the ore was exposed to the greatest heat near the bridge. The gases evolved were carried along by the draft, being in contact with the surface of the ore for a length of ten feet while passing over it; but on account of the narrowness of the hearth, the ore at the bridge had to be changed often with the cooler part at the flue.

The next step in improvement was the adoption of wider hearths, even wider than long. The heat was more uniform and the result better. In both kinds of furnaces the chlorination of the metals depends principally on the chlorine developed in the mass of the ore while passing through it; but once above the surface, the chlorine and volatile chloride metals have little chance to transmit their chlo-

hearth to the other is more troublesome. There are two men employed at a time, there being one ton and a half to two tons in the furnace. The hearths are either horizontally arranged, as the drawing shows, or only the first one is level and the

FIG. 7.—LONG ROASTING FURNACE, GROUND PLAN.

For the purpose of admitting air or steam a canal can be made in it. The fire-place, *g*, is 18 inches wide and 8 to 9 feet long, and 15 inches below the top of the bridge.

FIG. 5.—DOUBLE FURNACE.

other two are inclined; this facilitates the shifting of the ore. Each hearth is ten feet long and ten or twelve feet wide. After the first hearth there is a step of four to six inches, partly to divide the first from the others, but principally to contract the

The ash-pit, *h*, is made according to what seems more convenient, either as represented in Fig. 6 or as in Fig. 3. A deep ash-pit is more favorable for the preservation of the grates, as they are less heated. Each door is provided with an iron roller, *i*. A

and a half miles. Among other examples, the San Dumas mines gave over \$2,000,000 for 24 years; the Pavillon divided among its shareholders over \$6,000,000 per annum; the Sombrierite paid its shareholders \$5,000,000 in seven months; the San Avario paid \$54,000,000 in three years; the Gallego paid \$11,000,000 in six years; and the Real del Monte company has paid for years, and still pays, dividends averaging \$1,500,000 per annum, notwithstanding heavy expenses, among which were some \$150,000 yearly for drainage up to the end of 1868, when they completed the Aviadero adit, which is about four miles long, and which cost upwards of \$500,000. With proper protection of life and property, enormous results may be still expected from this country.

REVISING THE BIBLE.—It would seem that a serious attempt was to be made in England to effect a revision of the Bible. The object is to make only such alterations as are of importance, and in the style of the authorized version as far as possible. No change is to be made without strongly preponderating evidence. Scholars from all sects are invited to assist. It seems rather improbable, however, that any new version can be made which will be acceptable to all churches.

California and Immigration.

Immigrants from abroad are pouring into New York at the rate of over a thousand a day. They are dispatched thence to all parts of the country. Kansas, Nebraska and Colorado are receiving the largest proportion of these new settlers, while the older Eastern States are securing a considerable number. A few go into the Southern States, and others find their way to the shores of the Pacific. But it is very evident that those who come here are only a small percentage of the number to which the great and diversified resources of California justly entitle her. Whatever other reasons there may be, this one is plain: In the other States and Territories no exertion has been spared to attract immigration thither. Immigration Societies have been formed; special and reduced rates of transportation have been secured; agencies have been established in New York and the seaports; pamphlets, circulars and newspapers have been printed by millions, by railroad companies, land speculators and State officers, and circulated broad cast; and agents have been sent to Europe to perform the same work there in the districts from whence this great stream of emigration starts.

Until recently no organized efforts of this kind have been made in California. But our people are waking up to the necessity of an additional agricultural population, the development of the resource of the State, and the adopting of the same means to secure these objects that have been successful elsewhere. The advantages that California presents to the immigrant are so great that it is only necessary to bring them to the attention of the emigrating classes to insure their preference for our shores. But when here, they should be well received; the inducements and advantages which each section of the State has to offer, fairly set before them; the location of public lands yet open to settlement and the prices at which private lands are for sale stated; and every facility offered them to become settlers at once and permanent and productive citizens. Holders of large tracts of land, however, must make up their minds to sell portions of their property at fair rates and upon easy terms, to hasten and encourage the improvement of the remainder. They must not turn away the men who come offering by their industry to double and treble the value of their possessions.

The California Immigrant Union was organized to do this work. It is actively engaged in disseminating information concerning the resources of California and the inducements it holds out to immigrants, both in the Eastern States and in Europe. It has already done much in this way both directly and indirectly. It has dispatched an agent to Germany to circulate translations of its publications there, and by personal efforts in conjunction with its correspondents in the seaports, and by means of arrangements for the cheap transportation of passengers, many in large bodies and otherwise, seek to turn a desirable portion of the current of immigration in this direction. It is doing the same work in the Eastern States, so that with the foreign may come also an American element, in-

spired with the enterprise, activity and intelligence our free institutions and general education create. Here, it is calling upon the public-spirited and intelligent men of the interior to cooperate with it, by working for the benefit of their own counties and attaching to each the new population of which they stand in need. Its organizations and its operations have stirred up others to engage in this same style of work

the same work, and large numbers of both these papers containing this matter have been purchased and sent abroad, thus showing that as a mere business operation it pays newspapers to publish this style of matter. The large edition, (100,000) of an illustrated advertising sheet, published by Messrs. Wentworth & Bornek, as an extra *Weekly Alta California*, also contained this essay and much other matter of the same

addresses furnished, whenever good results are likely to follow. Strangers are always welcome there, and such general or particular information as they require concerning the public or private lands of the State is freely furnished. The following is the list of the officers of the California Immigrant Union:

President, C. T. Hopkins; First Vice-President and Manager, C. S. Capp; Second Vice President, Charles Crocker, Vice President Central Pacific Railroad; Third

Vice President, L. Gottig, President German Savings Bank; Secretary, C. W. Grant; Treasurer, J. Seligman & Co., bankers; General Agent, W. H. Martin. Trustees—L. Gottig; P. H. Canavan, Importer of wines and liquors; H. J. Booth, manufacturer; Alex. Well, of Lazard Freres; Chas. Crocker; Chas. Kohler, of Kohler & Frothing; F. Berton, banker, Consul of Switzerland; G. O'Hara Tasche, Danish Consul; S. Capp; A. Seligman; Thomas Breze, of Murphy, Grant & Co.; Chas. Clayton, merchant; C. T. Hopkins, President California Insurance Company; Aug. Heibing, of Strauss & Heibing; A. D. Bell; S. O. Putnam, Secretary Steam Navigation Company.

Honorary Committee—His Excellency H. H. Haight, Governor of California, President ex-officio; Hon. T. H. Selby, Hon. J. G. Downey, D. J. Oliver, Morris Speyer, Christian Christiansen, Jos. A. Donohoe, Gustave Mahe, Hon. Leland Stanford, Hon. Robert Watt, Hon. Milton S. Latham, G. B. Ceruli, Italian Consul; H. Barroillet, Peruvian Consul; F. Roseng, Hon. E. W. McKinstry, W. W. Hollister, John A. McGlynn, Joseph G. Eastland, A. R. Baldwin, J. W. Stow, L. L. Robinson.

Bean Culture.

Santa Cruz county is a great place for growing beans. The climate along the coast appears to be peculiarly favorable to the sure and prolific yield of this useful product.

Since the earliest occupation of this coast by the Spanish, the cultivation of the bean has been a leading agricultural interest. Wherever there is a Mexican settlement *frijoles* are as indispensable as Chili peppers, jerked beef, and *tortillas*.

So sure and profitable is the crop, that thousands of acres are yearly devoted to the culture in this county. For a general culture the white field bean, the Chili bean, and the Rosita are preferred. A few fancy varieties have been introduced by late settlers and cultivated to some extent, but no special favorite has yet inaugurated a bean excitement, although there would be as much sense in it as in the late "potato revival."

With a deep and thorough stirring of the soil they appear to do equally well on the bench lands and bottoms. I am assured that it is no uncommon thing to plow them three to five times from November to May, the month of planting, and that it pays to thoroughly work and pulverize the soil. The yield on well-cultivated soils will average 3,000 pounds to the acre. The wholesale price ranges from two to three cents on the ranch. [Considerable more than double

the average value of wheat to the acre.—Ed. Press.]

The old fashioned way of treading and pounding out, is the method of threshing still employed. Some sort of a machine is needed that will do the work quicker, cheaper and better.

A large quantity of beans were injured last season, between the time of harvesting and threshing from exposure to rains.

The fields are looking beautifully green now. The cultivators and hoes are at work, and the promise of an abundant harvest was never better. S. H. HERRING.

CORRESPONDENCE.—The correspondence printed this week from our traveling agents, W. H. M. and J. M. W., will both be found of much interest. The letters of our traveling correspondents will add a valuable feature to the present volume of the Press.

LITH. BRITTON & REY, S.F.

and probably greater efforts have been made to attract population and attention to our resources during the past six months than at any time heretofore.

The German translation of the prize essay written for the California Immigrant Union by Mr. John S. Hittell, entitled "California as a Home for the Emigrant, etc.," has been translated into German, and has appeared in the columns of the *Abend Post*, of this city, together with other matter which is eventually to form part of the pamphlet now going through the press. The matter has been stereotyped in duplicate, to facilitate the publication of future editions, and one set of the plates is to be forwarded immediately to Germany that large editions may be printed and distributed there. The *California Demokrat* and other German papers of this city have also published large extracts and abstracts from

sort, written expressly for extensive circulation abroad. Thus its subscribers, advertisers, publishers, and the California Immigrant Union have all been actively engaged in giving circulation abroad to this essay the Union receiving 5,000 copies as a consideration for the use of its essay in that edition, as well as several thousand copies additional from advertisers who were content to trust the Union with the task of distributing periodicals in the Eastern States and elsewhere.

The map of California we publish to-day was prepared expressly for the California Immigrant Union, and is to illustrate its pamphlet. The office of the California Immigrant Union is at 316 California street, and is kept well supplied with matter concerning the resources of the State, suitable for distribution abroad, which is furnished gratuitously to all who apply, or mailed to

Water Supply in Victoria for Mining Purposes.

A matter of vital importance to the mines is the water supply. This has received much attention in Victoria, and the colony is now in an advanced position in this respect. For not only has much been done by private individuals, but the Government also has given extensive aid where the miners have been too poor to erect the necessary works.

But the government has managed these things wisely, and has endeavored, as far as possible, to make such water-works pay for themselves. Having an excellent civil service, the cost of construction is restrained within reasonable limits, and hence the miner is enabled to get his supply of water at a minimum price; and not only is the miner benefited directly in this way, but it is rendered possible for manufactories to be erected in the mining towns! The water statistics of Ballarat show that in 1867 there were at least forty-five manufactories in this one mining camp! Let us look at these statistics for a moment.

The present water supply for this place is furnished from three reservoirs, having an aggregate of 130 acres, with a holding capacity of 292,000,000 of gallons, imperial measure, and a new one is proposed of an area of 200 acres, and a holding capacity of ten to twelve hundred millions of gallons. The aggregate length of races amounts to twelve miles; of mains, eighteen inches in diameter, to four miles 3,234 feet; of street mains, from three to nine inches diameter, 13 miles; of service pipe, 62,500 feet. The total cost of the work up to the end of 1868 was \$350,000; of this, \$50,000 was a government grant, and \$75,000 came from the government water-works' loan, the remainder having been raised by means of a loan upon a special rate and by revenue from the sale of water.

The rate of charges for 1867 was, per 1,000 gallons, measured by meter, as follows: For domestic use, \$1; for manufactures, 75 (now 50) cents; for government establishments, 62 cents; for baths, 25 cents; and for mines, 18 cents. When supplied by valuation, instead of meter, it was 3 to 6 per cent. per annum on the rated value of the premises; when sold from the stand-pipe, 25 cents per load of 120 gallons. There was no charge for water for watering the streets. The amount of water supplied during the half year ending Sept. 30, 1867, was 57,496,680 gallons (imperial measure, which is 20 per cent. more than the American gallon). Of this, 45 manufactories consumed 2,934,000 gallons. The revenue for the year ending the same date was \$37,633.69, and the estimated revenue for 1868 was \$47,960.

Now, these few statistics, on one subject only, give an idea of the enterprising spirit displayed by the people of this mining camp, who have, to a great extent, been thrown on their own resources, and been forced to get along without any great amount of external assistance. And often, when I hear of complaints made in the interior, that San Francisco withholds its capital, I think that it might be better for California mining camps, too, were they obliged oftener to work out, unassisted, their own salvation.

Up to the end of 1868, the government had completed, throughout the gold fields of Victoria, 38 reservoirs, covering an area of 950 acres, and holding 781,887,583 gallons, at a cost of about \$260,607. Besides these, it was building five reservoirs covering 950 acres, and holding 6,383,000,000 gallons, and estimated to cost less than \$900,000. These reservoirs, when built, are put under the control of local boards.

From January, 1863, to December, 1868, government had granted 201 licenses to divert, collect and distribute water throughout the various mining districts. The area of reservoirs constructed by parties holding licenses was about 340 acres; of races, 1,555 acres; the length of races was 403 miles; the capacity of the reservoirs, 546,681,902 gallons; and the maximum quantity to be diverted per diem, 242,667,460 gallons. The estimated amount of capital thus invested was \$1,088,645; and the annual rent paid to the government, \$7,462.50. There are other enterprises

commenced and proposed which will involve an estimated outlay of \$10,000,000.

The prices paid by the miners vary, of course, very considerably; but it appears to be conceded that not more than a few cents per thousand and gallons can be paid. At Buckland the quantities for sluice-heads range from 80 to 150 inches, and the charges per week (of 72 hours) from \$10 to \$15. In Beachworth district the weekly charge per sluice-head averages \$6.25. A number of licenses issued for the district were not accepted, because the government rent, fixed at the rate of two cents for 7,000 gallons, was deemed too high! In one case, a licensee, who proposed to divert 36,000,000 gallons daily, objected to accepting the license because the rent was fixed at £50 per annum—about 68 cents per day.

This question of water supply is of great interest to California and other States and Territories of the Pacific. If the mining camps here could obtain supplies for mining, irrigation, manufacturing and domestic purposes,—any one may imagine the result for himself. It will not do any harm to think on the subject. We say that we have as fine a country as Victoria (or any other place), and as smart inhabitants. It only remains to state that the Victorians have done these things! How about California? M.

Singular Freak of a Potato.

The *Rural New-Yorker* recently acknowledged the reception of several specimens of abnormal potato growth, in which a new potato had formed within an old one, and by its expansion in growing broken the potato apart. In remarking upon these singular growths, the *New-Yorker* says that it is either the case that the potato exhibiting this phenomenon has deeply-seated dormant eyes, or that it possesses the power under favoring circumstances of forming buds where none previously existed. Dr. Hexamer has found that potatoes which were

pared and every visible trace of eyes removed, would sometimes produce shoots and tubers. We copy an engraving of a remarkable instance of the abnormal growth of a potato. The specimen as it came from Mr. Wm. Langley, Garland, Pa., was a partially cracked tuber with a small one just forcing its way out of the fissure. Upon breaking open this old tuber a distorted mass of branches was found within, upon which several small tubers were forming, as shown in the reduced figure. Upon all the specimens of this singular growth that we have seen, the outer surface of the old tuber was dry and hard, and it is probable that when the bud or eye started into growth it found less resistance towards the center of the potato than it did in pushing towards the circumference.

A NEW FOOD FOR HORSES.—It is said that the Arabs cultivate a shrub called "Carroubain," which is found to be a valuable adjunct in the feeding of horses and mules—five pounds of it with four of barley being the feed. The plant only flourishes in very strong soil and a dry climate. A shrub twenty feet high will cover a space thirty feet in diameter, and yield some thirty pounds of fruit. It is coming into use in France for finishing off fat stock—many preferring it to barley. Why do not some of our California horticulturists make an effort to secure some of the plants, which are indigenous to the dry plains of Africa, and try them upon the parched lands of this State? There are many such plants, suitable as food for both man and beast, which might undoubtedly be cultivated to advantage in the driest portions of our interior and southern valleys.

HOW TO PRESERVE FENCE POSTS.—The *Prairie Farmer* says fence posts covered with boiled oil thickened with pulverized charcoal will last longer than iron.

Flax Culture in Santa Cruz.

There are 2,500 acres of flax cultivated in Santa Cruz county this season, mainly in the Pajaro valley. While much of the wheat last year was a failure, the few fields devoted to flax were such a success as to encourage a more extensive cultivation. Finer fields of flax than are growing in this county this season were never seen. To give stability to the business all that is now needed is a sure market for the straw and fibre, and an established price for straw and seed.

The Oakland Sack Factory last year paid \$10 per ton for the straw, baled, at the landing here. Some of the straw is now lying at the wharf. There are over 2,000 tons more of straw seeking a market this season.

About one-third of the straw in weight is fibre. It is a well known fact that for actual service, sacks made from this fibre are worth 100 per cent. more than sacks made from the jute that the Oakland mills are now using. There should be a difference in the price of linen and jute sacks sufficient to warrant the Oakland company to step forward in this enterprise, to encourage the farmer and make good serviceable sacks instead of the miserable jute sacks now made from imported material. If the farmers themselves will demand the linen sacks it will be doubly to their advantage. They will get good sacks and accomplish something towards creating a market for flax.

If looked upon liberally and right, there is a mutual interest between the farmer and manufacturer. It is something more than a speculation, it should be a settled and a permanent industry. There is not a flax brake in Santa Cruz county. Here is an opportunity for an investment in a sure and worthy enterprise. The fibre always has a market value. No place in this State has better conveniences for manufacturing than Santa Cruz. The cost of the flax brake that I noticed last spring in the Oakland mills was \$350. It has a capacity of one ton per day. Several such brakes might be employed here the year round.

Linseed.

The yield of seed to the acre ranges from 700 to 1,300, and this year will average 900 pounds per acre, making about 1,125 tons of seed raised in this county this year. This will net the farmer 3 to 4 cents. Last year the San Francisco Oil Works imported over 250 tons of seed, and they have already received several cargoes from abroad this season. Seed grown in this State is very rich and decidedly superior for oil.

As to the cultivation of flax, it seems to succeed best on land quite rich, but not too wet. Land free from weeds and very thoroughly cultivated is best. Where land is foul it should be pastured, summer-fallowed or occupied with some hoed crop the year before sowing to flax. The best field that I saw was plowed three times before sowing, and sowed in February with 50 pounds of seed to the acre. After the flax was well growing, it was weeded out by hand. This sort of care will pay. Rich soils that will lodge wheat, barley, oats, etc., will produce a very superior fibre. Although there is much difference in the appearance of fields, some of which, owing to poor tillage and filthy weeds, will not be fit for fibre, yet flax is considered a sure crop. The advantage and the necessity of a thorough cultivation is proved. With a proper spirit of enterprise on the part of manufacturers, this product so long neglected is found to be one of the important industrial interests and resources of California. S. H. HERRING.

TRULY TERRIFIC.—A telegram tells us that at Dry Creek a wonderful discovery has been made in the shape of some huge mastodon. As this "far exceeds in size anything yet discovered in the world," it may well be termed wonderful. Further information says that the distance between the eyes is four feet, that eight feet of a tusk had been uncovered, that the diameter of this was 18 inches and the length supposed to be 12 or 14 feet. After the first announcement we were prepared for bigger figures. Call-back Barnum.

WINE FROM LOS ANGELES.—An average of 18,000 gallons of wine and brandy has been shipped monthly from Los Angeles for the last seven months.

Illustrate your Inventions

IN THE SCIENTIFIC PRESS,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast. It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the Press will go further and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving. Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent. A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the SCIENTIFIC PRESS are a fair sample of the work of the artists who can always be found in our office.

The Celebrated Studebaker Wagon,

Manufactured by STUDEBAKER BROS MANUFACTURING CO., South Bend, Indiana. WAGON DEALERS, there are nine reasons why you should buy the above wagon:

- First—They are made of the best selected INDIANA TIMBER, thoroughly seasoned under cover.
- Second—They are made by experienced mechanics.
- Third—The lightest running and most durable Wagon in the market.
- Fourth—Their Thimble Skins never break, while all others do.
- Fifth—Most uniform and best proportioned Wagon in the market; any part of one will fit another, while other makes will not.
- Sixth—The only Wagon in which the STEPS SHOOTERS FROM—used; hence they have the best Wheel, which is actually the foundation of the Wagon, and should be carefully examined by persons buying.
- Seventh—They are sold only by responsible parties, and every Wagon is warranted to give entire satisfaction.
- Eighth—Because Teamsters will tell you they are the best Wagon for all purposes, on the road.
- Ninth—Last, but not least, Studebaker Brothers are practical men, attend to their business personally, and do not entrust it entirely to foremen, as is generally the case in large factories; hence the superiority of their work over all others. Sold by

CALIFORNIA-MADE FARM WAGONS FOR SALE.

We still continue to have manufactured in this city and vicinity a large number of these Wagons, made generally for two horses, Light, Medium-size, and Heavy, with either Iron Axles or Thimble Skins—thus ENCOURAGING HOME INDUSTRY, and demonstrating to the satisfaction of every intelligent observer the superiority of California-made Wagons, both as to style, materials and workmanship, over any Wagons sent here for sale, whether made at the State Prison, Jackson (Mich.), or at South Bend (Ind.), or any other Western place, while our prices are very much lower.

Of every description of vehicles now running in California, probably ninety-nine out of every hundred have been made in this State, and their superiority in standing well in this dry climate has been so well established throughout the past twenty years that it would, in the opinion of any FAIR DEALER, seem to be an improper reflection upon our many skillful mechanics in this branch of business, to say otherwise.

We are prepared to furnish any reasonable number of these Wagons on short notice.

Catalogues and price lists sent on application.

Persons wishing to purchase, visitors to the city, and all who may feel any interest in the matter, are respectfully invited to CALL, EXAMINE and COMPARE.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, requiring less power. The plow-shaped grooves rise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the mill.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F., Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, Gold Hill, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

Executed correctly and with dispatch.

HOME, SWEET HOME.

Mid pleasures and pal-a-ces,

"Live and Let Live,"

Is a good old adage, and we shall adopt it as our own. We do not pretend to do work at "less than cost," as some people advertise to do; but we do claim to do all kinds of printing as cheap as it can be done on this Coast—and we believe as cheap as it is done in Chicago. Customers, in the country or city, are invited to call in person at our office, or send their orders by mail or express, and they will be fairly dealt with.

PACIFIC BUSINESS COLLEGE,

Mechanics' Institute, 27 Post Street,

BET. MONTGOMERY AND KEARNY, SAN FRANCISCO.

THE PIONEER AND ONLY BUSINESS COLLEGE

On the Pacific Coast where BOOK-KEEPING is taught as practiced in the Counting-room.

PENMANSHIP.

In this useful and very important branch we challenge competition.

PROF. SEREGNI

Has obtained First Premiums at all the Fairs on this coast where his Penmanship was exhibited, and was awarded the MEDAL at the Seventh Industrial Exhibition of the Mechanics' Institute in 1869 over all competitors. His success as a Teacher is unequalled.

TELEGRAPHING.

The only place in the city where Telegraphing is taught by an experienced Operator.

We cordially invite the public to call and examine the merits of the College. Our Institute is patronized by the youth of fifteen and the man of fifty, where they receive instruction in Single and Double Entry Book-Keeping, Commercial Arithmetic, Commission Jobbing, Business and Ornamental Penmanship, Commercial Correspondence, Actual Business, Merchandising, Banking, Importing Railroad, Steamboating, Mining, Real Estate, Brokerage and Exchange, Mechanical and Architectural Drawing, Telegraphy, Orthography, French, Spanish, Italian, German and English Grammar. No CLASS SYSTEM. Each student receives individual instruction. No Vacations.

Sessions Day and Evening.

Oil Cake Meal.

THE BEST FEED KNOWN FOR LIVE STOCK.

We desire to call attention to Oil Cake Meal, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal, and in the United States Government Report of the Department of Agriculture for 1865, it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 per cent.; Barley Meal, 13 per cent.; Oat Meal, 18 per cent.; Oil Cake Meal, 22-100 per cent. For life-sustaining properties to all stock exposed to sudden changes of weather or over-driving, it has no equal.

For MILK COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It improves it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

For BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy, and of a much finer quality than when fattened on any other feed, and no feed known will so quickly prepare animals for market as Oil Cake Meal.

For HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness and evenness and glossiness of the hair.

For SHEEP there is no article of food known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price (\$25 per ton) it is the cheapest feed in market. It is now selling in New York at \$12 per ton gold; at \$50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested, has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the manufactory, King street, near Third. All orders will receive prompt attention. Address—

Pacific Oil and Lead Works.

Nos. 3 and 5 Front St., San Francisco.
26v20-lam3m

Dr. DUDLEY, having had long professional experience in South America, combined with a recent tour of three years devoted to visiting the most celebrated Oculists of Europe and other countries, is prepared and very especially prepared with every new and improved means for minutely diagnosing and treating all diseases, irregularities or obstructions of the eye, and their attendant complications, by the most scientific and approved modern ophthalmic practice. Rooms: No. 12 Montgomery street, opp. Lick House. Hours from 10 to 3. *Dr. parle Français.*

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets have been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged. L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester: Cross and Blackwell, London, &c. &c., and by Grocers and Oilmen universally. Agents, GROSS & CO., San Francisco. 1v20-lycwo

LAND! LAND! LAND!

YOUNG & PAXSON, No. 424 Montgomery street, offer for sale:

40,000 Acres in Fresno County;
7,000 Acres in Sonoma County;
3,680 Acres in Tulare County;
1,900 Acres in Contra Costa County;
1,800 Acres in Solano County;
3,000 Acres in Napa County;
1,280 Acres in Fresno County.

Also, many smaller tracts of Agricultural and Vineyard Lands. For full particulars of which, apply as above. YOUNG & PAXSON. 424 Montgomery street.

THE Scientific Press is devoted specially to matters of machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year.—White Pine News, May 4th.

SCIENTIFIC PRESS. Devoted to Mining, Farming and Mechanic Arts. Published weekly by Dewey & Co., San Francisco, at \$4 a year.

For variety of interesting matter this journal compares favorably with any of our exchanges. Coming as it does from the Pacific coast, and being made up almost entirely of original articles, it possesses an interest and a freshness peculiar to itself, and that is particularly attractive to us.

It gives us a sort of birds-eye view of the improvements and progress in the leading industries pursued on the western coast.

We should think every one who had spent a few years in California would consider this paper a necessity; and any one wishing to know of the industrial and scientific progress there will do well to subscribe for it. *Journal of Agriculture, St. Louis Mo.*

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—*New Age.*

LAYERS' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

PEARLS AND RUBIES. When rosy lips part, pearls should glitter behind them. To preserve and beautify the dental enamel, there is no preparation like Sozodont, among which the Bark of the South American Soap Tree, known to the natives as Quilla, and used by the Spanish Americans for cleansing without impairing the most delicate fabrics, is most important.

"SPALDINO'S OLIVE" useful in every house.

MULLER'S Brazilian Spectacles are just the thing for people fond of reading whose eyesight is beginning to fail. His great skill as an optician enables him to suit all conditions of sight. It is Muller who supplies the city with opera glasses. *

PATENTS ON THE PACIFIC COAST.—To those of our friends who desire to keep posted upon inventions upon the Pacific coast we say, subscribe for the SCIENTIFIC PRESS, published by Dewey & Co., San Francisco, Cal., at \$4 per year. The opening of the railway across the continent has given to all patents a much higher value in that portion of our country known as the Pacific alpe, and all interested will find the paper above alluded to a valuable reference. *Mechanic and Inventor, Detroit, Michigan.*

SCIENTIFIC PRESS.—This paper is one of the most valuable published on the Pacific coast for miners, mechanics and farmers. It contains each week illustrations of new machinery, descriptions of new inventions and discoveries, information of scientific developments and mechanical progress, with valuable articles in relation to agricultural and farming interests. All claims of patents issued to inventors on this coast are published in this paper. We can recommend it to our citizens, and hope Mr. Murray may meet with success in obtaining subscribers among them.—*Seneca Democrat*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye, Opacities of the cornea cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 314 Bush street. 25-520.

We call attention to the new portable gas burner—the only one that can be regulated to any size, flame, and burn without smoke or smell. Equal to any gas at one-fourth the cost. P. J. Philbrick & Co., 650 Market street, have county rights for sale for this valuable invention; also lamps for sale. No one should be without them who wants a good, cheap and safe light. 2120-4v

TREATMENT OF REBELIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Business FORTUNES are often made easily, quickly and legitimately by Patent Rights. We advise both sellers and purchasers of patent rights, reliable agents only. Dewey & Co. Patent Brokers, No. 314 Bush street, San Francisco, are one of the most honest, reliable firms in the United States. *

TO FARMERS.—Stevens & Bro's Egg Boxes, holding 30 dozen, supplied free of charge, by John Gray & Co., No. 210 Clay street, San Francisco, to all customers. The eggs are kept cool and free from moisture and mould, are in no danger of being broken, and require no re-counting. 20720-3m

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very highest quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10v18 6m B. F. HOWLAND.

MASON'S BREAD OF LIFE, for Dyspepsia, Coughs, Colds, Asthma, Catarrh, Hoarseness, Bronchitis and Sore Throat. Price, 25 cents per box. These lozenges are free from all dangerous properties. Compounded and put up by Dr. J. H. Mason, 750 Howard st. 16v20-3m

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

Microscopes for Scientific Investigation and Educational Purposes. Price list sent free. T. H. McALLISTER, Optician, 49 Nassau street, New York. 15v20-3m

Das. MARTINACHE & SMITH, Oculists and Aurists, 313 Bush street, between Montgomery and Kearny. Hours for consultation, 12 to 3. 16v20-3m

Boiler Feltz saves twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Block Tin and Solder Wire, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 457 Brannan street. 24v19-3m

New Mining Notices.

Globe Gold and Silver Mining Company.
NOTICE OF ANNUAL MEETING.—Location of Mine and Works: Monitor District, Alameda County, California. Notice is hereby given, according to law, that the ANNUAL MEETING of the Stockholders of the Globe Gold and Silver Mining Company will be held on Tuesday, the 24 day of August, 1870, at 4 o'clock, P. M., of that day, at the office of the Company, No. 401 Bryant street, the object of the meeting being to elect Trustees for the ensuing year, to serve till their successors shall be duly elected and qualified; also, to act upon a proposition to remove the office of the Company to Monitor; and for the transaction of such other business as may come before it. By order of J. WINCHESTER, President.

B. SHIRAF, Secretary pro tem.
Dated San Francisco, June 30, 1870. jy2-1m

Cordillera Gold and Silver Mining Company.
Company, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of June, 1870, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 321 Washington street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of August, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. juil

Office of Eclipse Consolidated Mining Company.
Company, 210 Battery street, San Francisco, June 20th. The Annual Meeting of the Stockholders of this Company will be held on Saturday, July 23d, 1870, at twelve o'clock, M., for the election of Trustees for the ensuing year and the transaction of any other business that may be presented.

ju25-4w SOLON PATTEE, Secretary.

Evening Star No. 1 Silver Mining Company.
Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of June, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 6, No. 321 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the second day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of July, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. New Advertisements.

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

IMPORTANT BOOK!

Now in Press.—Roasting of Gold, and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book will contain 120 pages and be issued about July 10, 1870. Price, \$2.50, coin.

WONDERFUL Scientific Discovery.
THE GREATEST EVER MADE.
Having baffled the Ingenuity of Chemists and Physiologists for Ages Past.

DR. CROWLY'S EMERALD HAIR BALM.

No EXAGGERATION, but a stern reality, verified by the undersigned:
Dear Doctor: I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly,
JOHN STAPLETON,
California street, San Francisco.
To W. J. Crowley, M. D., No. 20 Montgomery street, San Francisco. 1v21-1m

DR. ABORN
Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Auzerais House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

DR. ABORN.—I take pleasure in bearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.

Oakland, June 3, 1870. WM. HOSKINS.

No Painless Operations.
Dr. Aborn does not subject his patient to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.
Hon James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Goffe, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1v21-2m

NEW VOLUME, JULY 1, 1870.

SUBSCRIBE FOR THE

Best Illustrated Newspaper

—FOR—

PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to

Mining, Farming, Mechanic Arts AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the PRESS and illustrated Patent circulars sent free on receipt of postage stamp. DEWEY & CO., Publishers and Patent Agents, No. 414 Clay street, San Francisco.

RESPONSIBILITIES OF THE STOMACH.—The stomach is the most wonderful of all manufactures. It converts the nutrients taken into it into materials of flesh and blood. As the body wastes it re-creates its tissues, fibres and bones, renewing them we are told once in seven years. It performs this work by turning the food into the basis of the blood, which is the material of all of them. To tone this responsible organ when weak and disordered, to regulate its action and the action of its dependencies, the liver and the bowels, the most admirable of all medicines is Tarrant's Effervescent Seltzer Aperient. It invigorates the digestion, controls the secretions and purifies the blood. SOLD BY ALL DRUGGISTS.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

A Good Agent

Is wanted, on liberal terms, to travel for the SCIENTIFIC PRESS.

Metallurgy and Ores.

MINING SCHOOL.

Mosheimer's Practical Mining School

Will be reopened by the FIRST OF JUNE, and prac-
tical instruction given in all branches of Assaying,
Crushing, Amalgamating, Concentrating, Smelting and
Refining Ores; also Erecting Furnaces and Reduction
Works of every kind. To give all miners a chance to
learn Assaying of Ores (what everyone ought to) I have
reduced my former charge for

Assaying Ores.....\$ 50.00
To work Gold and Silver Ores..... 100.00
Smelting and Refining, including Assaying..... 160.00

Many gentlemen who have been taught in my estab-
lishment will bear testimony that in a few days they
learned more than they expected to learn in a month.
Before going into mining, every man ought to know
how to test ores, and then he will go to work with pru-
dence and never fail to be successful. Apply to

J. MOSHEIMER.
Office, 328 Montgomery street; Works, 2,005 Powell
street, San Francisco. 22v20-3m

San Francisco, March 30, 1870. 15v20-3m

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

DEWEY & CO.

U. S. and Foreign Patent Agents, Scientific Press Office, 414 Clay street, San Francisco.

THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigation purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

MANUFACTURED AND FOR SALE BY

PACIFIC PUMP MANUFACTURING COMPANY,

318 Pine street, San Francisco.

jj2a601

WIESTER & CO.

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

A new and valuable GRAIN LIFTER, for raising fallen down Grain that it may be secured by the Header knives. County Rights for sale. Send for particulars.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for drying, and can be folded so compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO and PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

A NEW CORK EXTRACTOR.

This is a simple device of practical utility. It is adapted for Hotels, Saloons and family use. The tightest cork can be drawn with a mere nominal outlay of strength, and without any risk of bruising or hurting the hands. They will be furnished, plain or silver-plated, at manufacturing cost, to parties purchasing Rights. Any person of energy can soon realize the cost of a State Right by selling the Cork Extractors, as they sell readily and afford a large profit. Send for circular.

P. DAVIS' WIRE AND PICKET FENCE.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a new and valuable invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence, sent on application.

RYAN'S NEW METHOD OF MAKING WHEELS.

To make indestructible iron wheels with little labor and at small cost, is the object of this invention: The hub and spokes are all made out of a single piece of iron. It is first forged down at the ends to the thickness required for the spokes, leaving a hub in the center. The ends are then split into four or more strips (each, as shown in the cut above). A represents the hub; B, C, D, E, when spread to their proper position, form the spokes to one-half the wheel. When the other half is split and spread in a similar manner, the spokes are then rounded and shoulders formed on them ready to receive the tire or rim. It is claimed that the great amount of labor and expense heretofore required in making wrought-iron wheels is obviated by this novel mode of construction. There probably never has been a wheel made that is so durable as the Ryan Wheel, and yet the method of construction is so simple that it can be made by any ordinary mechanic in a common blacksmith shop. All territory west of the Rocky Mountains for sale in States or counties. Thomas Ryan, of Scott's Bar, California, is the inventor. Sample wheels, and the iron from which they are made, can be seen at our office, 314 Bush street, San Francisco.

A PAYING BUSINESS—FOR SALE.—The entire interest in a valuable Patent for the Pacific Coast; with Horse, Wagons, Goods, Machinery, etc. A business that any one can engage in, and although new, is already paying large profits.

WIESTER & CO.,

314 Bush Street, San Francisco.

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted.....	\$2,500
Second—For the second best design and plan.....	2,000
Third—For the third best design and plan.....	1,500
Fourth—For the fourth best design and plan.....	1,000
Fifth—For the fifth best design and plan.....	500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,

JOS. G. EASTLAND,

CHAS. E. McLANE,

City Hall Commissioners.

Advertising and Subscription

Rates for the Scientific Press.

SUBSCRIPTIONS IN ADVANCE:—One year, \$4; six months, \$2.50; single copies, 10 cents; Monthly Series, \$4.60 per annum; Quarterly Series (stiff paper binding) \$5.

ADVERTISING RATES.

We shall adhere to the following rates for advertising in the SCIENTIFIC PRESS from this date:

1 week.	1 month.	3 months.	1 year.
One sq. (10 lines agate), \$1.50	\$3.00	\$8.00	\$32.00
Two squares.....	3.00	6.00	15.00
Three squares.....	4.50	9.00	20.00
One-fourth column.....	6.00	12.00	28.00
Half column.....	12.00	20.00	64.00
One column.....	20.00	40.00	100.00

Two inches.	Three inches.	Four inches.
One inch.....	2.00	6.00
Two inches.....	3.75	7.00
Three inches.....	5.25	12.50
Four inches.....	6.75	16.00

RATES BY THE LINE.

Per line.—One week, 25 cents; one month, 80 cents; three months, \$2; one year, \$5.

Per line, ten lines or more.—One week, 20 cents; one month, 30 cents; three months, 80 cents; one year, \$3.20. MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in consular, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

All advertisements in the PRESS appear in both the MONTHLY and QUARTERLY SERIES of the SCIENTIFIC PRESS, which (by special arrangement) are placed for FREE READING in the principal hotels, steamboat and steamship saloons, depots, and public reading rooms and libraries in San Francisco and the Pacific States. Many volumes are also bound, thus affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—our advertisers. Better referees, or more reliable names, cannot be found in this advertising columns of any newspaper in the world.

DEWEY & CO.,

Publishers and Patent Agents.

No. 410 Clay street, San Francisco. Jan. 1, 1870.

Time Tests the Merits of all things.—For Thirty Years PERRY DAVIS' PAIN KILLER has been tested in every variety of climate, and by almost every nation known to Americans. It is the almost constant companion and inestimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it.

It is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, and is admirably suited for every race of men on the face of the globe.

Be sure you call for and get the genuine Pain Killer, as many worthless novelties are attempted to be sold on the great evil-tien of this valuable medicine.

Directions accompany each bottle.

Price 25 cents, 50 cents, and \$1 per bottle.

Sold by all medicine dealers.

Reading for the Hour.

SEA MOSS AS FOOD.—Great improvements have lately been introduced in the manufacture of farina, which consists of the starchy principle of the various grains, roots, etc., which are suitable for conversion into flour. These improvements have served to greatly increase the consumption of such of the sea mosses as consist largely of starch, but which have heretofore not been very popular as food, by reason of the difficulty in removing from the flour its peculiar marine or fishy taste. The most important of these mosses is the *Lichen islandicus*, largely used for food by the inhabitants of Iceland, who rarely obtain either wheat or corn bread, and whose limited stock of breadstuffs compels them to have recourse to every species of vegetable production which can be induced to grow in their inclement climate. This moss, and another variety, which is found upon the shores of New England, and in many localities in Europe, has been somewhat largely used as food in this country and on the European continent—chiefly in the preparation of blanc-mange. The recent improvements which have been introduced in its manufacture have removed those objections, which have hitherto been a bar to its use, so that it is now one of the most convenient, useful and pleasant substances employed in fancy cookery. A small tablespoonful is sufficient to thicken a quart of milk. It is quite as nutritious as corn starch or arrow-root, seldom burns to the pan, and “sets” in a mould for blanc-mange as quickly as currant jelly. It is really quite an addition to the housekeepers’ stock.

WHY HORSES DO NOT BREATHE THROUGH THEIR MOUTHS!—The soft palate, as it is technically called, *velum palati*, is a sort of curtain affixed to the roof of the mouth, in the region of the palatine arch; it has a free edge which rests upon the epiglottis. It slants in a posterior direction, so that anything in the shape of food coming from the mouth, raises and pushes it backward; but anything coming from the oesophagus or trachea, pushes it forward and downward, closes it, and thus prevents all egress. So that air is expired and respired through the nasal outlet, and all matter vomited from the stomach must also be ejected through the nostrils. In the act of coughing, however, which is a spasmodic action, the air returns in body and with force sufficient to raise the velum palati, so that a passage through the mouth is at the moment secured.

The mechanism of the soft palate is as follows: Its composition is nearly the same as that of the hard palate; yet it abounds more in glandular substance and muscular fibre; by means of the levator palati, the substance is raised. On the lateral and internal portion of the membrane we find bundles of muscular fibres, constituting a pair of muscles known as *depressors*, which aid in retaining the palate in its place, viz., on the epiglottis. From the above brief remarks the reader will perceive that it is not natural for a horse to breathe through his mouth.

M. TWAIN'S AGRICULTURAL EDITORIALS.—Turnips should never be pulled; it injures them. It is better to send a boy up and let him shake the tree.

The guano is a fine bird, but great care is necessary in rearing it. It should not be imported earlier than June or later than September. In the winter it should be kept in a warm place, where it can hatch out its young.

It is evident that we are to have a backward season for grain. Therefore it will be well for the farmer to begin setting out his cornstalks and planting his buckwheat cakes in July instead of August.

Concerning the pumpkin.—This berry is a favorite with the natives of the interior of New England, who prefer it to the gooseberry for the making of fruit-cake, and who also give it the preference over the raspberry for feeding cows, as being more filling and as fully satisfying. The pumpkin is the most esculent of the orange family that will thrive in the north, except the gourd, and one or two varieties of the squash. But the custom of planting it in the front yard with the shrubbery is fast going out of vogue, for it is now generally conceded that the pumpkin, as a shade tree, is a failure.—*Galaxy for July.*

The John Fitch Steamboat.

We take from the *Columbian Magazine* for December, 1786, in possession of the Pennsylvania Historical Society, the accompanying sketch and description of the first steamboat in America. The inventor says in his letter to the editor of the *Magazine*:

“The reason of my so long deferring to give you a description of the steamboat has been in some measure owing to the complication of the works, and an apprehension that a number of drafts would be necessary, in order to show the powers of the machine as clearly as you could wish. But as I have not been able to send you herewith such drafts, I can only give you the general principles. It is, in several parts, similar to the late improved steam engines in Europe, though there are some alterations—our cylinder is to be horizontal, and the steam is to work with equal force at each end. The mode by which we obtain (what I take the liberty of terming) a vacuum, is, we believe, entirely new, as is also the method of letting the water into it and throwing it off against the atmosphere without any friction.

“It is expected that the engine, which is a twelve-inch cylinder, will move with a clear force of eleven or twelve cwt. after the frictions are deducted. This force is

Sex in Potatoes—Late Hoeing.

We copied an item two or three weeks since from the *Rural World*, in which a correspondent, Mr. Perry, of Saratoga, claimed that in every variety of vegetable, as in the animal world, there is both male and female, and that in some vegetables the sexes are combined, as in the potato, one end of which the writer asserts is male and the other female.

A late correspondent of the same paper thinks that Mr. Perry cut his potatoes to single eyes and planted the stem end, and it didn't come up very well—hence, he suddenly arrived at the conclusion that it was a masculine chap; then, meeting such good results from planting the other end, he sets that down female. Correspondent No. 2 suggests “that the same principle is developed in the potato that we see in trees and vines—the tendency to the better development of top buds. We know that the higher buds on the vine always push first, because they are stronger or better developed. Just so, precisely, with the potato. The buds at the base, or around the stem end of the potato, are not, as a rule, so well

The Santa Cruz Fuse Factory.

While journeying through Santa Cruz county, I visited the manufactory of the Lake Superior and Pacific Fuse Co., located on a tributary of the San Lorenzo river, called the Zayate, and about seven miles from Santa Cruz. This company use only the best quality of Dupont's sporting powder, prepared especially for them. They manufacture two qualities of fuse, but use the same powder in both sorts. The one marked “water-proof” has one covering of tape and two of composition. That marked “submarine” has two coverings of tape and three of composition. This has stood the test of submersion in fourteen feet of water for five hours. The difference in the cost of manufacturing is about \$1 for each one thousand feet. The company use machinery patented by Messrs. Urrer, Dunstone & Blight, in 1863. They have invented several important improvements, which they design getting patented. Their present method of working is kept strictly secret.

Their machinery is driven by a set of three turbine wheels of their own invention. These

THE FIRST STEAMBOAT BUILT IN AMERICA.

to act against a wheel of eighteen inches diameter. The piston is to move about three feet, and each vibration of the piston gives the axis about forty revolutions. Each revolution of the axis moves twelve oars or paddles five and a half feet (which work perpendicularly, and represented by the stroke of the paddle of a canoe). As six of the paddles are raised from the water six more are entered, and the two sets of paddles make their strokes of about eleven feet in each evolution.

“The cranks of the axis act upon the paddles about one-third of their length from the lower end, on which part of the oar the whole force of the axis is applied. Our engine is placed in the boat about one-third from the stern, and both the action and reaction turn the wheel the same way.

“With the most perfect respect, sir, I beg leave to subscribe myself your very humble servant,
“JOHN FITCH.”

In Fitch's letter to the steamboat company, on the 26th of December, 1790, he says:

“I have given my country a most valuable discovery, on the 30th of August, 1785, for which I have received no compensation, and I doubt not but common justice will induce them to do something for me, especially when they can do it for the benefit of our empire.

“Another inducement which urges me to pursue this scheme is to put it out of the power of future generations to make excuses for the present one. And if I should die in penury, want, wretchedness and rags, that my country may have no excuse, and that I may have the secret pleasure in the contemplation of receiving real pity from future generations.”—*American Engineer.*

TO SILK-GROWERS.—Mayor Selby has received a letter from Bessiges, France, asking the price at which silkworm eggs and yellow cocoons can be obtained from California. The writer is owner of a large establishment at Bessiges, and seems disposed to send large orders to this State. He requests that answers be made in French to the following address: Marje Bonzize, Proprietaire, Bessiges, France.

developed as the blossom end buds; sometimes they are in round potatoes—but in long potatoes the blossom end or upper buds or eyes are much the strongest, and as a matter of certainty would produce better fruit. Just upon the same principle that the highest apple upon the tree is the best.”

The eyes of a potato, according to N. W. Hardy in the *Western Record*, are all connected together by roots running through the potato, and if disconnected, every eye will start; while if the potato is planted whole, the roots of the eyes, of course, remaining uncut, only a part will start. The same writer says that potatoes have two sorts of roots: one that the tubers grow on, and another set which spreads abroad, often to quite a distance from the hill, and near the surface of the ground, drawing in food and other moisture—hence the injury from late sowing of potatoes. Excessive and late hilling of potatoes is very prejudicial. If the ground is left nearly level, then surface roots will much more readily drink in the dews and such other moisture as may be condensed from the atmosphere, by the surface soil, in the absence of summer rains, as in California. The potato plant needs considerable light and air; hence, an open and erect growth should be encouraged as much as possible by light seeding, etc. A good circulation of air among the tops and the consequent healthy growth thereof is the best preventive of the rot.

DIFFERENT WAYS OF PRAYING.—Not a had story is that told of the sailors of three nations in a storm. The Scotchman prayed extempore; the Irishman had by heart his prayers to the Virgin and saints innumerable; but the Englishman went through the ship hunting for a prayer-hook, and could not find one until the storm was over.

are very ingeniously constructed, and will operate all together or separately, driven under a pressure of 44 feet. They are now turning out 10,000 to 15,000 feet of fuse daily, and feel assured that with the improvements in the machinery now contemplated they can make from 30,000 to 50,000 feet per day with the same working force. The company are manufacturing the most important parts of their improved machinery. The day of my visit they had set up a first-class engine lathe. Their other tools, etc., exhibit a readiness for business.

The proprietors expressed the determination to never send one foot of fuse to market which they would fear to trust their own lives with.

My own experience in the use of fuse convinces me that there is a grave responsibility resting with the manufacturer. Two of my companions in blasting were one day hurried out of existence, horribly crushed and mangled at my very side, by the fuse holding fire, and finally exploding the charge when all thought of danger had passed. When I held the quivering, dying form of one in my arms, and mingled my poor sympathy with his last thoughts of far-off friends, and his agony of pain and of parting, I wondered why I was left unscathed to witness such distress, and if the man that made this fuse felt murder in his soul!

But it sometimes happens that fuse becomes damaged in transportation by exposure to damps, etc., and is actually thrust upon the market by traders for a miserable profit.

In the year 1865, I am told that some Lake Superior miners were greatly troubled to get good fuse from this cause. And to avoid the possibility of imposition and danger, they clubbed together and bought up all the poor fuse, and spent one fine evening in boyish sport, burning the same in the streets. They got good fuse after that merry-making, and probably made business dull for the undertaker.

S. H. HERRING.

The University of Alabama has but aix students.

We observe the *Scientific Press* (a journal of much merit, published in San Francisco) has, in the number of May 14th, quoted (without crediting us—inadvertently, we presume,) from an editorial formerly published in our journal, a description of the method of manufacturing Wyckoff's Patent Water and Gas Pipes. It says these pipes are manufactured at Ithaca, N. Y., which is a mistake. They are manufactured at Elmira, N. Y.

We find the above in the *Gas-Light Journal* of June 2d. We failed to see the original article in question. It doubtless appeared during the interval when, as we remarked in the *Press* at the time, we missed receipt of that valuable journal for several weeks. We found the item in the *American Artisan* for April 27th. We did not credit it to that paper, because it had no appearance of claiming originality. We aim to be especially careful to give credit in all cases where credit is due. A paragraph in another column, prepared before we saw the above clipping, will show that we go so far as to urge the recognition of some other editorial work besides original composition.

WHY DO CHILDREN DIE?—In answer to this question, the *Medical Recorder* holds the following language: "The reason why children die is because they are not taken care of. From the day of birth they are stuffed with food, choked with physic, splashed with water, suffocated in hot rooms and steamed in bed clothes. So much for in door. When permitted to breathe a breath of pure air once a week in summer, and once or twice during the colder months, only the nose is permitted to peer into daylight. A little later they are sent out with no clothes at all on the parts of the body which most need protection. Bare legs, bare arms, bare necks, girted middles, with an inverted umbrella to collect the air and chill the other parts of the body. A stout, strong man goes out in a cold day with gloves and overcoat, woolen stockings and thick double-soled boots, with cork between and rubbers over. The same day, a child of three years old, an infant of flesh and blood and bone and constitution, goes out with hose as thin as paper, cotton socks, legs uncovered to the knees, neck bare, an exposure which would dissolve the nurse, kill the mother outright, and make the father an invalid for weeks. And why? To harden them to a mode of dress which they are never expected to practice. To accustom them to exposure which a dozen years later would be considered downright foolery. To rear children thus for the slaughter pen, and then lay it on the *Lord*, is too bad. We don't think the Almighty had a hand in it."

THE HAT is the vulnerable point of the artificial integument. I learned this in early boyhood (by personal experience), and the effect has been to make me sensitive and observant respecting this article of dress ever since. Here is an axiom or two relating to it. . . . A hat which has been *popped*, or exploded by being sat down upon, is never itself again afterwards. . . . It is a favorite illusion of sanguine natures to believe the contrary. . . . Shabby gentility has nothing as characteristic as its hat. There is always an unnatural calmness about its nap, and an unwholesome gloss, suggestive of a wet brush. . . . The last effort of decayed fortune is expended in smoothing its dilapidated castor. —O. W. Holmes.

NEW ENGLAND AID FOR PACIFIC COAST INSTITUTIONS.—In reply to a question of the *Examiner*, the S. F. *Bulletin* gives these instances of donations from New England to institutions on this coast, which are not meant to include all that has been given, as other considerable sums have been donated. College of California, \$7,000; Pacific Theological Seminary, \$25,000; College at Oak Grove, Or., \$50,000. Total \$82,000.

GARDEN SCHOOLS IN JAPAN.—It seems that schools are sometimes, at least, held in the gardens in Japan. Amid the luxuriant flowers and wide-spreading trees, where streams bubble and lakes add their calm beauty to the scene, the pupils sit and learn. Pleasant, certainly.

THE Income Tax is no more, whereat the papers on the coast are rejoicing greatly.

ORANGE WINE.—Peel the oranges very carefully—out the pulp across and squeeze by hand or otherwise, so as to express all the juice. To one gallon of this juice add seven quarts of soft, pure water, and eight pounds of good brown sugar. Mix the orange juice, water and sugar together, and strain. A five-gallon keg, demijohn, or other vessel, may be used according to quantity of juice. Fill the vessel to the brim, reserving to every five-gallon vessel two bottles of fresh juice, as prepared, to supply the waste of fermentation. When no more fermentation can be detected, lay a bag containing about a pound of sand over the mouth of the vessel. After a couple of months cork the vessel slackly, wrapping a cloth around the cork. Draw it out occasionally to let off the accumulated gas. In about six weeks or two months after loosely-corking—during which time the vessel should be kept in a cool place—cork tight; let it thus remain six weeks or two months longer, when the wine will be ready for bottling and use. This will be found a very pleasant drink.

As for the dimensions of the planetary system, at least as we know them at the present time, it has a diameter equal to sixty times the distance of the sun from the earth, or about 5,700 millions of miles. If we desire to form some idea of this immense extent of space, we must estimate it by the time which certain bodies would require to pass through it. Light, which progresses at the rate of 180,000 miles per second, requires 8 hours and 17 minutes to travel from one end to the other of the planetary system; as for a cannon ball, if it continued to travel with a uniform velocity of 495 yards per second, it would take no less than 626 years; sound would require 845 years to travel over the same distance.

The thickness of planetary space is much less extensive than its length. In considering it represented by a line perpendicular to the plane of the earth's orbit, we find it nineteen or twenty times less than the long diameter, or 300,000,000 of miles.—*The Sun*.

TUNNELS AND NARROW GAUGE RAILROADS.—On the first of April there remained a trifle less than three-quarters of a mile of the Mount Cenis Tunnel to be excavated. The work has progressed lately at an average rate of 340 feet per month. It is expected that the tunnel will be finished by July, 1871. The authorities of Turin are making arrangements for the inauguration of the opening. A universal industrial exhibition is being organized for the occasion. The Hoosac Tunnel (Mass.) is progressing at the rate of 10 feet per day. The central shaft is descending at the rate of one foot per day, and will be finished in about four months. The excavation at both ends of the tunnel amounts to over two miles. The little Festinog Railroad in Wales, with its diminutive engines and gauge of one foot eleven and a half inches, has attracted a great deal of attention, and similar roads will probably be adopted in this country to a great extent in new regions.

LUNAR RADIATIONS.—The Council of the Royal Astronomical Society, at the last annual meeting, after stating the results of Lord Rosse's observations upon this subject, which have already appeared in the *Press*, go on to say: "Some later observations have been made upon the same subject in Paris, respectively by M. Baille, at the Ecole Polytechnique, and M. Marié Davy at the Paris Observatory. The former employed a concave mirror of 39 centimeters aperture to condense the moon's rays upon his pile, and also made use of a Thomson's galvanometer. The one conclusion at which he arrived was, that the full moon, at Paris and in the summer months, gave as much heat to his pile as a radiating surface, 6.5 centimeters square, maintained at boiling-water temperature and placed at a distance of 35 meters."

DISRAELI in his last novel, *Lothair*, having attacked Prof. Goldwin Smith, as the latter thinks, this gentleman replies in a letter which contains rather strong expressions. If, as he asserts, Disraeli's expressions "are the stingless insults of a coward," why notice them?

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

MEADOW VALLEY EXTENSION CO.—Lincoln county, Nev. June 28. Capital stock, \$600,000, in 6,000 shares. Trustees: L. Maynard, A. J. Bowie and Henry Janin.

BLACK CLOUD S. M. CO.—White Pine June 18. Capital stock, \$1,100,000, in 22,000 shares. Trustees: George Hearst, C. H. Pollard, J. W. Pearson, E. P. Peckham and E. J. Ryan.

The following have been recorded in the Secretary of State's office, Sacramento:

STOCKTON SHIP CANAL CO.—June 23. Directors: C. G. Hubner, S. Eldridge and T. K. Hook.

MANHATTAN QUARTZ M. CO.—Nevada county, Cal. June 23. Capital stock, \$300,000, in 3,000 shares. Trustees: T. W. Sigmourney, G. W. Baldwin, T. Watson, D. Watt and O. Maltman.

SAN FRANCISCO, OAKLAND AND ALAMEDA RAILROAD CO.—June 29. Consolidation of the S. F. and Oakland and the S. F. and Alameda Railroad companies.

Meetings, Elections, Etc.

CITY RAILROAD CO.—June 20. Directors: Robt. B. Woodward, Allen B. Gladding, M. P. Jones, Isaac Hyde, Jos. H. Moore, E. DeWitt, R. Kent.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, June 30, 1870.

W. T. Atwood states the following as the approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

Per cent.	Per ton.	Per cent.	Per ton.
12 per cent. ore	\$24 00	18 per cent. ore	\$41 40
13 " "	26 65	" " "	44 65
14 " "	29 40	" " "	48 00
15 " "	32 25	" " "	52 60
16 " "	35 20	" " "	57 00
17 " "	38 25	" " "	61 00

Ores assaying above 30 per cent., \$2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

THE Beethoven Festival lately held at New York did not prove a financial success, and there is an acknowledged loss of \$40,000. Somehow New York does not seem to have very strong musical propensities. People there are too busy making money, to attend to such matters.

BLACK DIAMOND CUTTING TOOLS.—This substance is now used extensively in turning off grindstones, for which purpose it is found to answer admirably. Drills for glass are also made of it. We have before spoken of its use in mill-stone dressing.

TO MINERS, MILLMEN AND METALLURGISTS.—Kunstel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the *Scientific Press*, San Francisco.

SCIENTIFIC PRESS.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of *Scientific Press*. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information.—*Central Coast Gazette*, Jan., 1870.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

WM. H. MURRAY, California and Nevada.
S. H. HERRING—California.
THOMAS POTZER—California.

A. C. KNOX, City Soliciting and Collecting Agent.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	\$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 yrs and 6 mos.	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	20
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-Chief	10
On every appeal to the Judges of Circuit Court, D. C.	20

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

DEWEY & CO.,
Patent Agents, San Francisco.

WILLIAM H. MURRAY, traveling agent and correspondent for the *Scientific Press*, of San Francisco has been in town during the week soliciting patronage for this paper. He is now in Cope District, where he will meet with encouragement from the intelligent miners, who are ever anxious to learn as well as teach. Mr. Murray's letters from the north will prove a valuable feature of the *Press*.—*Elko Chronicle*, June 6th.

San Francisco Metal Market.

PRICES FOR INVOICERS.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

THURSDAY, JUNE 30, 1870.

IRON.—Duty: Pig, \$9 per ton; Railroad, 50¢ per 100 lbs.; Bar, 1¢ per lb; Sheet, polished, 3¢ per lb; common, 1¢ per lb; Plate, 1¢ per lb; Pipe, 1¢ per lb; Galvanized, 2¢ per lb.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st, between Fremont and Beale, San Francisco.

Fire or Tubular Boilers, with plain circular or spiral
courses. Upright Fire or Tubular Boilers, Locomotive and
and Marine Boilers, and Wrought Iron Tanks of every de-
scription.

Hydraulic Pipe supplied at reasonable rates. In or-
dering, give the quantity of water to be supplied, height of
the fall, and total length of pipe, so as to enable the firm to
determine the diameter of the pipe and thickness of iron to
be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in re-
pair with promptness.

To Boiler Makers and Machinists in the In-
terior.—The firm is prepared to furnish estimates of
Boilers, supply new Heads, drilled and punched, and attend
to the selection and forwarding of Iron for Boilers, Pipes
and other purposes.

Plans, Drawings and Specifications.—The firm
is prepared to make out Plans and Specifications, receive
estimates, and superintend the Erection of any Machinery
that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in de-
veloping the plans of those who have the ideas, but not the
practical experience necessary to put the same in form, by
making Drawings of their inventions, giving them the bene-
fit of their practical knowledge in the construction of Ma-
chinery, and attending to the manufacture and introduc-
tion of their inventions. 1v16qr

Wood Cutting & Splitting Machine.

This Machine is made of cast iron, constructed with-
out saw, only with "STEEL KNIVES," and by removing
half a dozen bolts, is easily taken apart or put together
in a few minutes; will cut and split more than 40 cords
of fire-wood per day, hard or soft wood, as using for
stoves and railroad, and requiring but two men to tend
it. Can be driven by steam or horse power. The patentee
offers the largest inducements to foundrymen and
dealers in patents, for the purchase of State and County
Rights, and for the manufacture and sale of these Ma-
chines in all parts of the country. Secure the right
soon. Apply to ANTHONY JACKSON, LA CROSSE,
Wis. P. O. Box 409. 25-20-1m

ECONOMY AND CLEANLINESS

Are to be found in the use of the

PATENT SPRING BED.

They are the cheapest and best in the market. Manu-
factured on Twelfth street, bet. O and D, SACRAMENTO
Careat filed Aug. 9, 1869. [15v20] G. B. DEAN..

HIBBERD, SANBORN & CO.,

South Point Mills, Berry street,
Between Third and Fourth, San Francisco. Orders from
the country promptly attended to. All kinds of Stair Ma-
terial furnished to order. Wood and Ivory Turners. Bill-
iard Balls and Ten Pins. Fancy Jewels and Fasteners.

Greatest Discovery Ever Made.

MR. J. W. MAO, while a resident in New Zealand,
was so afflicted with the RHEUMATISM, that for years
he was completely crippled and unable to attend to husi-
ness. The symptoms were of the worst type—knees
painful and swollen, with sinews contracted; shoulder,
arm and hand rendered useless, and accompanied with
continued excruciating pain. While in this state of suf-
fering, he got acquainted with a native of the country,
who applied to the parts affected a composition spread
on coarse canvas, the properties of which were so won-
derful that in a short time all the pain left him, the
swelling disappeared, his sinews relieved, and he was
able to resume his usual avocations. So effectual has
been the remedy, that to this day he has enjoyed per-
fect health, without the slightest return of his former
complaint. Knowing the great blessing such a remedy
would be to those afflicted with this painful disease, he
with great difficulty and expense obtained this secret of
preparing the Plaster; and during the many years MR.
MAO has applied these Plasters in New Zealand, Tas-
mania, New South Wales, and this city, their effect has
been marvelous, giving to the most painful and long-
standing cases sure and certain relief. The most in-
credulous will be convinced by referring to these per-
sons: B. W. OWENS, 405 Front street; F. B. ALDERSON,
Traveling Agent for Dewey & Co., 414 Clay street; James
Flynn, 519 Mission street; Michael Gorman, No. 6 Front
street; Mrs. W. S. Wright—lats of Gilmore House—516
Folsom street, now agent at Virginia City; E. Shenley,
corner Montgomery and Filbert streets; W. M. Mc-
Leod, Depository merican Tract Society, 557 Market
street, and a host of others, who all bear testimony to
this unparalleled healing powers of J. W. MAO'S
(rightly termed Magic) Plasters, for the cure of Rheu-
matism, Gout, Weak Loins, Tender Feet and Neuralgia.
J. W. MAO may be consulted at his office, rooms Nos.
34, 35 and 36, 126 Kearny street, San Francisco, between
the hours of 9 to 12 A. M., 2 to 4 P. M. and 7 to 9 P. M.
18v20-3m

The Latest, Cheapest, and Most Durable.

CRANDALL'S

PATENT SPRING BED.

This invaluable Spiral Spring Bed combines all the
good without any of the bad features of the common
spring mattress. It consists of a framework of springs
resting on a bed of stronger springs, thus giving it
nearly double the elasticity of any other bed. The
springs are self-supporting, each pair being independent
of the others, and consequently the tendency to sag or
incline toward the middle is avoided. Unlike other
spring beds, they require no upholstering, and, of
course, afford no harbor for fleas or dust. The medical
faculty have pronounced it the best bed in use. It com-
mends itself to those who have examined and used it.
They invariably pronounce Crandall's Patent the best
Spring Bed ever offered to the public.

These Beds are on exhibition and for sale at the Cab-
inet Warerooms of

JOHNSON & BEST,

No. 413 PINE STREET, RUSS BLOCK.

Between Montgomery and Kearny. Also at

639 Market Street, near New Montgomery.

Beds guaranteed to give satisfaction

Hold Your Horses.

The subscriber has the pleasure of announcing to the
public a new, novel, cheap, and useful invention, which
every person owning a horse needs for every-day use.
It is called a "HORSE-HITCHER." You need no longer
have your shade trees and fences ruined by hitching to
them, nor the street of the city blockaded by posts.
With this arrangement any horse may be left in the
street or field with perfect safety. Try, and you will
hold fast, because you will find it of use everywhere.
This invention is one which pays
industrious Agents large profits. It is a new thing,
never having been offered to the public before. No
charge is made for boxing, and no order for less than
one dozen is sent, at \$10, prepaid or O. O. D., unless a
sample, which will be sent on receipt of the retail price,
\$1.25. One agent sold in three weeks over 500. State,
County and Town Rights for sale. Apply to ANTHONY
JACKSON, LA CROSSE, Wis. P. O. Box 409. 25-20-1m

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary mind. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
2019-11 Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller force the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settles made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

TO MILLMEN.

FOR SALE CHEAP.—A 10-stamp mill complete; engine about 35 horse-power; cylinder 12-inch bore and 30-inch stroke; boiler 16 feet long and 48 inch diameter; weight of stamps complete, 650 pounds. The whole is as good as new; has only been running four months. Will sell either engine or battery separate, and deliver it on the railroad, at Auburn if required. For particulars apply to W. NAGEL, 702 Bush street, San Francisco, or to MOUNTAIN CO., Forest Hill, Placer county. 16v20-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24 1866; and Oct. 9, 1866.

ADAPTED
FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

No. 423 Washington Street, San Francisco.

Inventor of the Explorers', Miners', Millers' and Smelters' Friend, the Prospectors' "WEE PET" Assaying Machine, etc., which obtained a GOLD MEDAL at the San Francisco Mechanics' Institute Fair of 1869.

Practical Instruction in Assaying.

Patented Sept. 7, 1869.

Fixed for Weighing, Roasting, Crucible Fusion and Ignition. Packed in a 5 or 6-inch box. Arranged for Calculation and the general purposes of the Analyst and Assayer.

These illustrations show the Portable Assaying Machine in three positions. The first for weighing, roasting, drying, crucible fusion and ignition. The second, packed with all tools, fluxes, etc., for traveling. The third, fixed for the prospectors' assay, where a calculating balance records in plain figures the percentage of base metals, thousandths fine, or 5 per cent of bullion, and the dollars (or oz.) per ton of gold and silver assays; for the analyst to fuse ten or twenty grains, alone, on charcoal, or with an alkaline carbonate, etc., for open and close test tubing, or to dry, sublime, evaporate, boil, distill, filter, etc.; showing also the tools and flux-box. This Machine is in ended for prospectors, who can, after a few hours of instruction, assay their own rock, at a cost of ten cents per assay, which can be performed so much more easily in the field that it must supersede all other methods. Price, \$100, which includes instruction, tools, calculating balance, weights, fluxes, etc.

Important to Assayers.**Crucibles.****The Patent Plumbago Crucible Co.**

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,**CRUCIBLES, and other fire-standing Goods,****Battersea Works, London.**

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Minter and Refiner, U. S. S. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869.—Messrs. A. S. Hallidie & Co., 619 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE, Messrs. A. S. Hallidie & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO., Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs. A. S. Hallidie & Co.—Gentle:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adams, Gautier, and Tanton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS. On hand and for sale by the Agents,

Number 2.

Hydraulic Nozzle.

When the California miner went to work to extract the precious metal from the deep placers, he had many difficulties to contend with. To bring water in sufficient quantities, often from a great distance and over a most unfavorable ground, was no small labor. But he went ahead, regardless of financial and engineering obstacles, and did not stop to discuss the possibility of the work until he had finished it. He accomplished many things which a better educated man would have hesitated long before undertaking. He committed many blunders and often reaped no benefit from his labors; but he did what he set out to do.

Hydraulic mining having become a settled and important fact, it remained only to perfect it in its details. One of the late improvements, designed to better utilize and more easily direct the tremendous force in the hands of the miner, is the so-called "Hydraulic Chief," a general idea of which will be obtained from the accompanying cut. It is a mechanical arrangement for giving the nozzle any required horizontal or vertical direction and holding it in any position without the necessity of much manual power.

The operator, standing at the end of the lever, can easily direct the stream to any point. He is further removed from the spot operated on and can more easily command a view of the work, than with the common nozzle. The pipe will stand firm when placed in any position. The inside construction is such that there is the least possible friction for the water, and no bolts, etc., to break the stream. There are other advantages which the hydraulic miner will readily see. Two sizes are made, throwing three-inch and six-inch streams.

This is certainly an improvement over the old ways where two men were required to do what one can now perform without much labor, danger or personal discomfort. The cut shows how the nozzle is moved in a vertical direction; it moves in a joint at the flange marked "Hydraulic Chief," in a horizontal direction. Any further information desired may be obtained by addressing Mr. F. H. Fisher, Nevada City, Cal.

Mr. BALBACH, of San José, the inventor of the buggy spring lately illustrated in the PRESS, recently visited San Francisco for materials to put up buggies to fill his orders. He is positive that he has the best spring ever used, and that it will "take" wherever known. His enterprise deserves success.

TRAM RAILWAY.—The agent in California for the Tram Railway Company of Great Britain, whose system was illustrated in the PRESS of June 18th, is Mr. B. B. Lewis, of Alleghany, Sierra county.

THE Central Pacific Company have commenced work on the new bridge across the American river, near the site of the one burned last March.

Henderson's Direct-Action Steam Pump.

There are several features in this pump which are worth the attention of those interested in such matters. It is constructed

FISHER'S PATENT HYDRAULIC NOZZLE.

with the purpose of running regularly and quietly at any required pressure and speed. Its prominent feature is the steam balance valve, operated partly by the tappet, but

composition metal, either lift or ball, according to the work required.

The pumps are models of simplicity and are so arranged that access to the pistons and valves is most easy. They have been

HENDERSON'S PATENT DIRECT-ACTION STEAM PUMP.

mostly by the exhaust steam which is admitted by the positive motion of the piston, so that it cannot fail, no matter how slow it may work. There is no dead point,

of their satisfactory performances. We have a table of the mean results of competitive experiments made with a Henderson and another pump. What the other

HENDERSON'S PATENT DOUBLE-ACTION FORCE PUMP.

but the engine will start at any part of the stroke. The pump is the same in both figures. The arrangement of the valves in the piston with a considerable mass of water between them is another feature peculiar to this pump, which conduces to its smooth working by preventing the jerk caused by the sudden stopping of the moving mass of water. The valve chambers are arranged with brass seats, to accommodate valves of vulcanized rubber or

was, we know not, and hence do not give the table; but it was said to have been chosen for its excellent workmanship. The result was fifty per cent. gain in favor of Henderson's pump. The manufacturers stand ready to guarantee their pump for any situation they may personally recommend. These pumps having been at work for some six years, their efficiency is well known. For further particulars address W. M. Henderson, Philadelphia.

The New Mining Bill.

We give, in another column, Mr. Sargent's new bill, as last amended, in relation to the sale of mineral lands, which the telegraph has announced as having passed the lower House, with an almost certainty of passing the Senate and becoming a law. This Act is amendatory of the one passed in July, 1866, which was limited to quartz mines. The bill as now amended does not change the law with regard to acquiring title to quartz mines, but extends the privilege to placer mines.

Under this, as under the old bill, no individual quartz miner can acquire more than one claim of 200 feet in length by location, and one by right of discovery; while no association can exceed the limit of 3,000 feet upon any one vein; but in extending the bill to the placer mines, as now proposed, any individual or association of placer miners may secure, as a minimum, ten acres or any increased number of acres up to 160, the exterior limits of which shall conform to the legal subdivisions of the public lands.

If a party wants less than a quarter section he must pay for the survey of the subdivision. Mining claims seldom terminate on the lines of the Federal surveys, to meet which difficulty two or more persons or associations may unite to get one patent, covering not more than a quarter section for each, and they can make their partition afterwards.

As the mines are open for purchase only to persons who have spent money upon them, the bill will operate to encourage the settlement of our mining counties and the development of their resources. The price per acre is fixed at \$2.50.

As this amendment consists merely in the addition of six new sections to the eleven contained in the old bill, it does not relieve miners of the onerous and useless expense and trouble in proving up titles, etc.

In addition to the expenses of proving title, surveying, advertising, etc., the claimant must also prove the expenditure of at least \$1,000 on the claim, and there is no provision in the bill to prevent a second party from coming within the proposed 160 acres of the first party and commencing work. In order to carry out the intent of the bill, some provisional protection should have been allowed. The bill, though good in the main, is not without its defects, which will be gradually developed by its practical working, and in due time amended.

REDUCTION WORKS AT SALT LAKE.—We see it stated that the Messrs. Woodhull Brothers of Salt Lake have commenced the erection of two smelting furnaces. It is said that the works will be ready about the end of two months.

A NEW OCCURRENCE.—We see it stated in a German paper that platinum has been found in the lead mines of Ibbenbüren in Westphalia. If true, this is a new and interesting occurrence of this metal.

Communications.

Notes from Idaho Territory.

[Written for the Scientific Press.]
Silver City.

Silver City, the county seat and largest town of Idaho Territory, is situated 6,250 feet above the level of the sea, on the sloping sides of Jordan Creek cañon, 180 miles north of Elko, 103 miles from Cope district, and 60 miles south of Boise City. Jordan creek runs southward and empties into the Owyhee river, which flows into Snake river, the large south fork of the Columbia. The town is prettily situated, and surrounded by high precipitous hills. On the east are the War Eagle Mountains and on the west the Florida Range. There is no doubt but these mountains contain a very large amount of the precious metals; rough and ragged as they look, they hold concealed treasures whose value is inestimable. These mines are not merely touched, and yet during the year 1869 Wells, Fargo & Co. alone shipped from Owyhee \$835,181.07 worth of bullion.

Around these mountains are heavy banks of snow, from 10 to 25 feet deep in places, where the drifts have collected. To catch the waters formed by the melting of this snow for the placer claims, the miners have erected ditches and flumes, thus turning to good account these forbidding features. But in other places there are beds of beautiful flowers, whose colors afford a strange contrast to the cold whiteness of neighboring localities.

Silver now has about 1,500 inhabitants. The houses are mostly of wood, but I see quite a number of fire-proof granite buildings of really fine appearance. There is a good public school; one Odd Fellows and two Masonic lodges exist, and an order of Good Templars, who own a neat hall. There are two assay offices, two banks, an express office, a foundry, several hotels and a theater. Nor must I forget the weekly newspaper, the *Owyhee Avalanche*, owned by Hill & Millard, which is independent in politics, ably conducted and a credit to the community it represents. To Mr. Hill I am indebted for considerable information about the country, which I have freely used in my notes. The climate is represented as very healthy; in summer it is delightful, but in winter snow falls to a great depth and the storms are violent.

Mountains—Mines, etc.

The Owyhee mountains are of granitic formation, and in some places rise to a height of 1,500 feet above the city. Rough and steep, in many places their bald summits stand out in bold relief. Red sand white fir grow in considerable abundance in the gulches, and native mahogany is plentiful on the slopes and peaks. The latter is used for fuel and the former is manufactured into lumber and shingles, there being three saw mills in operation in this vicinity.

From the summit of War Eagle, two and a half miles from Silver, we can get a magnificent view. Snake River Valley can be seen for two hundred miles as it stretches away to the east and west; the Boise Mountains are visible to the north and the lofty peaks of the Salmon River range still farther away to the northwest. The winding stream, the vast plain and the hazy mountains in the dim distance beyond—all form a landscape wonderful in its beauty and needing a master pencil for its description.

The gold and silver quartz mines of Owyhee form its principal resources. Placer diggings were discovered seven miles below this place in the spring of '63 by a party of prospectors from Boise Basin. In July of the same year the first quartz vein was discovered and named the "Whiaky." Since then hundreds of locations have been made and some of them quite extensively developed. The veins produce both gold and silver, in some the gold and others the silver predominating. I have been told by miners that in some places the rock of the mountains to the west and northwest of the city will assay \$3 to \$6 per ton; that all the gulches there are rich in gold; that horn silver has been found in the gulches; and that detached specimens of tin ore have been picked up.

Ida Elmore Mill.

The Ida Elmore mill, built by the Lincoln S. M. Co., is located on the west side of Golden creek, near the city. It has twenty stamps, twelve Wheeler pans and six large settlers. The 60-horse power engine (with 14-inch cylinder and 30-inch stroke) with its two large boilers, burning 5 cords of wood daily, was made at the well known Miners' Foundry of San Francisco and shows good workmanship. The mill runs through some 22½ tons of ore daily (from the Ida Elmore mine) and could crush more if necessary. The rock is soft and works easily. The cost of working the ore is \$7.50 per ton, and it is thought that this sum can be made to include the expense of mining, hauling, etc. There are 16 receiving tanks and all necessary improvements to make this a first-class mill. I saw here 4½ pounds of amalgam which had been obtained during the last few days. The ore is worked up to 87½ per cent. of the assay value. There is a large amount of tailings on hand—over 6,000 tons, which have been accumulating for some years past—which will yield \$12 to \$20 per ton. They have about the same amount of buildings as the Owyhee Co., and the two are gotten up in the best of style. The work done is most satisfactory. The owners are Col. D. H. Fogus, W. R. Carter and John M. Wilson, the latter acting, (and ably) as General Superintendent.

The Owyhee Mill.

The Owyhee mill, owned by the Owyhee M. Co., is located on the east side of Jordan creek. Mr. W. D. Walbridge is General Superintendent of the company, and Mr. J. M. Adams is Superintendent of the mill. Mr. Adams kindly conducted me through the mill, showed me the different points, and gave me the following notes: There are one Blake's crusher and 20 stamps of 650 pounds each, with an average fall of 8½ inches, making 68 drops a minute. The ore is crushed wet, and discharged through No. 5 screens. The machinery was manufactured by the Pacific Foundry, of your city, and is well made. There are three slum yards, with a capacity for 1,500 tons of alum, into which the battery water runs from the settling tanks. There are also 16 pans (10 Wheeler and 6 Varney), 8 settlers, 1 Knox pan (old style) for cleaning amalgam, 4 agitators, 2 Hungerford's concentrators, and Evans' patent rifles; 1 lathe and 1 Worthington force pump. All these are driven by a steam engine of nominally 85 horse-power, though much more is got out of it.

The ore crushed during the past six months came from the Poorman and the Golden Chariot. The former mine is owned by the Owyhee M. Co., and the latter by the Golden Chariot M. Co., and this ore is custom ore. The average yield of the Poorman ore during that time was \$30 a ton; of the G. Chariot ore, \$60 a ton. The per cent. of assay value, obtained from each, not including loss in alums (as they are saved and subsequently worked), was 94. The average per cent. of assay value obtained from G. C., including loss in alums, was 93; from Poorman, 90.

The capacity of the battery—running night and day—on G. Chariot ore is 38½ tons a day. The capacity of pans on G. Chariot ore, running each charge six hours, 33 tons a day, and the capacity increases as the time is shortened. Capacity of mill on Poorman ore, 60 tons a day, running the pans 4 hours, as there is a large loss of *bulk* in the slum. The average cost of working Golden Chariot and Poorman is \$7 a ton. The cost of working Poorman, \$7 a ton. After the tailings leave the mill they run over a double set of blanket sluices 250 feet long; and even the concentrations barely pay the expense of working, while the tailings, unconcentrated, are perfectly worthless. There are now 200 tons of Golden Chariot ore at mill, and 300 tons of Poorman.

I was very much pleased with everything about this mill. The whole machinery works finely, and the arrangements are most excellent. Everything is kept neat and tidy and in the most perfect order. There are rooms for chemicals and assaying, and under the very able management of Mr. Adams, who does all the assaying and analyzing, and who has been most successful in working the ores up to a high percentage.

Golden Chariot Mine.

The most productive mines of Owyhee are situated well up on War Eagle Mountain. Here close together are the famous Poorman, the Ida Elmore, the Golden Chariot, the Peck & Porter, and the Mahogany mines.

I was kindly taken through the Golden Chariot by the very obliging foreman, Mr.

W. H. Clark, who, by the way, has accepted a situation in the Amador mine, Jackson county, Cal., and whose successor, Mr. J. F. Cassell, has just arrived here. The shaft is down about 400 feet. At the bottom, in the fifth level, about sixteen feet to the south of the shaft, a rich body of ore has been struck which has caused considerable excitement. In places I was able to see free gold and large amounts of silver sulphurets. It looks splendid. For thirty feet north of the main shaft, in the fourth level, the ledge is from four to six feet wide, and elsewhere the width varies from one to four feet. The first, second and third levels are worked out, but on the fourth, stoping is being done on each side of the shaft. Sixty men are employed night and day extracting the ore. For blasting, giant powder is employed when sinking, but for ordinary work common blasting powder, from the California Powder Works. The rock is very hard, and in some few places it costs upwards of \$40 per ton to get it on the dump. There is a fine hoisting engine of over 15-horse power. The company can extract 350 tons monthly. They have the ore crushed for them, and pay \$14 per ton for milling, besides \$2 for hauling in the summer, and more in winter. There is some talk of erecting a mill near the mine, whereby not only will the expense of working be reduced, but it will also be possible to work much ore which does not pay now.

Ida Elmore Mine.

The Ida Elmore is on the same vein as the preceding. Mr. J. Schmidt, the foreman, did the honors here and piloted us about. The shaft is down 450 feet from the surface. There is a large tunnel, 1,250 feet long, running in a northerly direction to the Oro Fino mine, which drains the upper levels, but the water from the fourth and fifth levels is hoisted in large water buckets holding 150 gallons. The ore is of the same general character as that of the Golden Chariot. Some fifty miners are employed, and twenty tons of ore are raised daily. The hoisting engine is of 20-horse power, and the hoisting works are a little larger than the Chariot's. The dumps are full and the mill is well supplied.

These are the two principal mines of the district. Both are looking very well and giving strong evidences of permanency.

Fairview.

Near these mines is a small town named Fairview, from its position, which commands a view of the surrounding country for a long distance. Here there is a fine hotel, kept by Mr. A. D. Miller, also several stores and saloons. In summer this is a very pleasant place, but in winter the cold winds are too violent, and snow drifts up too high alongside of the house.

W. H. M.

[TO BE CONTINUED.]

Fossil Tooth from Table Mountain.

The following interesting description, by Prof. W. P. Blake, has been very kindly sent us by Mr. G. A. Treadwell, of Big Oak Flat, Tnolunne county, with permission to publish it:

The fossil tooth found by Mr. D. T. Hughes, 1,700 feet under Table Mountain, and 300 feet below the surface, is very interesting. I have carefully examined and compared it with specimens in the Smithsonian Institution. It proves to be a back lower molar of an equine animal of the genus *Hipparion*, or a closely allied genus. This genus is one of the connecting links between the *Paleotherium* and the horse.

The specimen closely resembles a fossil in the Smithsonian museum, from the Pliocene formations of the Niobrara river in Nebraska, not only in size but in the foldings of the enamel, and particularly in the posterior part of the tooth, but it differs enough, in several particulars, to justify the belief that it is a distinct species. Dr. Leidy does not attempt to determine, specifically, the specimen from Nebraska, but considers it closely related to, if not identical, specifically with, *Hipparion gratum*, possibly *Protolippus placidus*.

The size of the Table Mountain specimen, which is considerably worn by attrition in the gravel, is: Length, 11 lines; breadth upon the crown, 9 lines; breadth at the base, 10 lines; thickness, anteriorly, 4 lines, posteriorly, 2 lines.

This is an extremely interesting fossil for many reasons. It is an extinct form. It is the first of the kind discovered west of the Rocky Mountains. It adds to the list

*Described by Prof. Leidy in his work upon the Extinct Mammalian Fauna of that region, p. 319, pl. XIX, Fig. 7.

of the fauna of the period antedating Table Mountain—a list which includes the mammoth (*Elephas*, from Knight's Ferry), the rhinoceros, and an animal allied to the elk. I have believed that remains of man were also found under the lava; but upon this point, after diligent inquiry, I am satisfied that the evidence is insufficient. But we now add this fossil allied to *Hipparion*, and I regard it as another indication that the Table Mountain beds are Pliocene and homotaxial with those of the Bad lands of Nebraska.

As a link between the more modern genus, *Equus* and the *Paleotherium*, it has a general interest. Huxley regards the genus *Hipparion* as a good example of what he calls a "lineal type" in distinction to the "intercalary type." He says: "The genus *Equus* is represented as far back as the latter part of the Miocene epoch, but in deposits belonging to the middle of that epoch its place is taken by two other genera, *Hipparion* and *Hipparitherium* (or *Anchitherium*), and in the lowest Miocene and upper Eocene only the last genus occurs.

"In the *Hipparion* the teeth nearly resemble those of the horses, though the crowns of the grinders are not so long; like those of the horses, they are abundantly covered with cement. The shaft of the ulna, if reduced to a mere style, ankylized throughout nearly its whole length with the radius, and appearing to be little more than a ridge on the surface of the latter bone until it is carefully examined. The front toes are still three, but the outer ones are more slender than in *Hipparitherium*, and their hoofs smaller in proportion to that of the middle toe. In the leg the distal end of the fibula is so completely united with the tibia that it appears to be a mere process of the latter bone as in the horses. "In the horses, finally, the crowns of the grinding teeth become longer, and their patterns are slightly modified; the middle of the shaft of the ulna vanishes, and its proximal and distal ends ankylize with the radius. The phalanges of the two outer bones being left as the splints."

In conclusion, this eminent authority asserts his belief that the types of the *Hipparitherium*, of the *Hipparion* and of the ancient horses, constitute the lineage of the modern horses, the *Hipparion* being the intermediate stage between the other two.

Owen, in his Comparative Anatomy and Physiology of Vertebrates, gives figures of the teeth and bones of the leg of the *paleotherium*, the *hipparion*, and the horse, illustrating the transition from the first to the last by the gradual appression of the toes, leaving, at last, only the splint bone of the horse.

We may now more confidently expect to find in some of the still older formations of California, the remains of progenitors of *Hipparion* and relics of the *Paleotherium*. Fossil remains of the horse have been found in several localities; one, I remember, upon Mare Island, with teeth of *Elephas*, and another locality near Martinez. Some very large teeth have been dug out of the bitumen springs west of Buena Vista lake, in the Tulare valley; but it is probable that these are of the modern wild horse of that valley.

This addition to our knowledge of the fauna of the Table Mountain period makes it still more interesting to determine beyond any doubt whether stone implements, or any other evidence of the existence of man at that time, have been found under the lava of the mountain imbedded in such a way that no question can arise as to their existence in the deposits prior to the outflow of the lava. As the reported finding by Dr. Snell, or others, of stone implements under the lava cannot be verified by any one who has long resided near, and worked in the tunnels, I am disposed to conclude that Dr. Snell's relics may have been washed out of earth taken from the outer slopes or margins of the lava-capping, and that they are not as ancient as he believed them to be.

WM. P. BLAKE.

Washington, June 4, 1870.

NICKEL-PLATED STEAM ENGINES.—The exposed portions of engines may by nickel plating be furnished with a bright non-corroding surface cheaper and better than silver plating. The Brooklyn Nickel Plating Co. have thus plated a small vertical engine, and the idea seems likely to "take."

COMET MINE, YELLOW PINE.—Word comes from Los Angeles that for the purpose of securing capital sufficient for fully developing this mine and also for erecting smelting works, one of the owners has gone on to England.

Mechanical Progress.**Comparative Cost of Narrow-Gauge Railways.**

The gauge of the Festiniog railway in North Wales is termed the two-foot gauge, although really one foot eleven and a half inches. On the occasion of the recent visit of a Royal Commission to the railway, C. E. Spooner, C. E., read an elaborate paper giving a description and history of it. We find it in *The Engineer*, and quote a paragraph or two from the latter part: "I do not recommend for light railways so small a gauge as two feet; but I consider that two feet six inches is ample for all purposes. The large amount of traffic that can be done on lines of this kind is really surprising, particularly with the 'Fairlie engines'; in fact, I may say fully 75 per cent. of that which can be effected on a four feet eight and a half-inch gauge. I have no hesitation in saying that the narrow-gauge principle worked on the Fairlie system, having a permanent way well laid to two feet six inch gauge, with good iron rails, of not less than 55 pounds to the yard, or steel rails of 50 pounds, with proper rail fastenings, will last 20 years; the sleepers will require renewing in from eight to ten years. By the excessive weight thrown on one wheel of an engine on the standard gauge lines, the rails are crushed out and not worn out, as is the case on lines of the small gauge. The width of a single line in the clear should be nine feet six inches. A single line of railway in England of the above type, through an ordinary country, would not cost much more than one-half of a standard gauge line, of four feet eight and one-half inches; in a mountainous district the cost would be even less comparatively, consequent on the advantages that would be given by a narrow gauge in following the contour of the hill-sides, regardless of sharp curves, thus avoiding tunnels, viaducts, and heavy earthworks, which would be inevitable upon the larger gauge system."

MAKING CASTINGS UNDER PRESSURE.—At the late annual meeting of the Institution of Civil Engineers in London, Mr. Roebuck exhibited castings made by the process of Messrs. Smith & Locke, of Massachusetts, and a set of apparatus for making them. *Engineering* says of the castings: "These included reproductions in brass of elaborate dies, chased work, bas-reliefs, electrotypes from wood engravings, etc., all the examples having a finish as perfect as the models from which they were produced. The perfect 'face' upon these castings is indeed astonishing. It is intended to apply the system not only to producing castings in brass, but also in steel, and we understand that an attempt will shortly be made to employ it for the production of large castings in Bessemer steel, taken direct from the converter. Amongst the examples exhibited were some files cast in brass, and having the teeth as sharp as if they had been cut in the ordinary way. These were, of course, shown merely as samples; but similar castings are about to be made in steel by the process, and if these are successful, the effect will be to almost revolutionize the file manufacture. Indeed, the very low cost at which moulds, however elaborate, can be produced, the perfection of the castings obtained, and the fact that scarcely any skilled labor is required for their production, combine to render Messrs. Smith & Locke's process one capable of extensive application and of vast commercial value."

PROJECTILE ANCHOR.—Experiments were recently made at Portsmouth, England, with "Rogers' projectile anchor for life-saving purposes." An anchor weighing 128 pounds and carrying a one-inch whip line rove through a block, was thrown to a distance of 156 yards from the shore by means of an eight-inch mortar, with a charge of eight ounces powder. A hawser was rove by means of the whip-line, and a ship's launch with ten men hauled out over the spot.

UNIFORM MOTION WITHOUT FLY-WHEELS. Messrs. MacGeorge & Rigg have devised turning gear which consists of a small supplemental oscillating cylinder, which serves as a reservoir of pressure, absorbing the excess during the middle of the stroke, and giving it back again towards the ends.

Crosland's Three-Cylinder Engine.

This is a recently patented form of the compound engine. *Engineering* illustrates a specimen, of 60-horse power, now constructing. We quote from the description: "Mr. Crosland's engine is specially designed for working with steam of a high pressure, say, 150 pounds per square inch, this steam expanding from the first into the second, and from the second into the third cylinder successively. In the engine we illustrate the cylinders are respectively 9 inches, 18 inches, and 30 inches in diameter, the stroke in all cases being 2 feet, as the connecting rods are all coupled to one crank pin. The engine is run at 82½ revolutions per minute. The crank pin is 5 inches, 4½ inches, and 3½ inches in diameter at the three bearings respectively, and the main bearings of the crank shaft are 9 inches in diameter by 20 inches long. The steam pipe leading to the first cylinder is 2 inches, that connecting the first and second cylinders, 2½ inches, and that connecting the second and third cylinders, 4 inches in diameter. The valve gear is arranged at the back of the main framing, the motion being communicated to the slide valves through rocking shafts, while provision is made for adjusting the gear whilst the engine is running. The air-pump, which is 10½ inches in diameter, and 2-feet stroke, is placed in a line with the large cylinder, and is worked by a prolongation of the piston rod of that cylinder through the bottom cover. This arrangement gives ready access to the valves, etc. The cylinders are all steam jacketed, and efficient arrangements are provided for removing the condensed steam, and for the lubrication of the working parts. The framing is of strong and neat design, and the total weight of the engine, including the fly-wheel, is 34 tons. The arrangement of the cylinders gives a very equable turning power and thus renders the engine particularly adapted for mill purposes."

GAS AS FUEL FOR STEAM MAKING.—*Engineering* gives a paper read June 7th, before the British Association of Gas Managers, by G. Goddard, in which is mentioned a new arrangement, patented by Arthur Jackson, for generating steam by gas. We quote: "The invention consists of a vertical tubular boiler of very small dimensions; the tubes are not more than one inch bore, and are placed very close to each other, so that an enormous heating surface is obtained; beneath the tubes on a revolving plate are a number of atmospheric burners, each supplied with a cock, so that the heating power is completely under control and can be increased or diminished at pleasure. The space required for a four-horse power boiler is only 48 inches. The time occupied in getting up the steam to 40 or 50 pounds to the square inch is from 20 to 25 minutes. A very small quantity of gas is required to maintain the pressure of steam when the engine is at rest, and hence the value of the invention, where intermittent power is required—as in working hoists in warehouses, hotels, etc.—particularly as the full power may be almost instantaneously restored when needed. The average consumption of gas per horse power per hour is about 100 cubic feet."

SAFETY SWITCH.—We find in the *London Mining Journal* of June 4th a notice of a new safety locking switch, the invention of Mr. John Brunton. "The motion of the cams which move the points brings up a block or wedge, which, when the motion of the lever is completed, effectually fixes the switch or point in its position; but before such movement of the points-lever can be made the pointsman must move the distance signal to danger, and block the line; and, further, the movement of the points-lever must be complete, and the switches locked or wedged before he can move the other signal-lever, and show the 'all right' signal to the train advancing to run into the branch line or siding."

HYDRAULIC "JIM CROW."—This is a simple and effective tool devised by Tangye Bros., Birmingham, for bending rails. It is very manageable, and, unlike the screw crow, can be unshipped instantly. It is used also for breaking heavy steel rails. By merely nicking the rail with a chisel, it may by the crow be easily and evenly broken off, and much time saved.

Scientific Progress.**Animal Combustion and Ordinary Combustion.**

We quote the following from an article by Liebig on the Source of Muscular Power,—translated for the *Bowdoin Scientific Review*:

"Carbonic acid is never produced in the living body by the union of oxygen with carbon. It is not, in the ordinary sense, a combustion product. In order to comprehend correctly the difference between the combustion process under a steam boiler and that in the animal body, the formation of organic compounds in plants must be considered. They are all formed from carbonic acid and from atoms of carbonic acid, more or less modified, which in the animal body undergo retrograde metamorphosis into the carbonic acid atoms, which were their source. By their formation, under the influence of sunlight, heat (or sun force) becomes fixed (*gebunden*), or, as we say, latent; by their disintegration it again becomes free, and the maximum amount is set free when the disintegration of these substances corresponds exactly to their formation. Take, for instance, as a starting point, carbonic acid with sugar in their simplest empirical formula; we have:

A glance at both formulas shows that the sugar is carbonic acid, in which one equivalent of oxygen is replaced by one equivalent of hydrogen. Carbonic acid is not destroyed by the formation of sugar; one of its constituents has been exchanged. In the decomposition of sugar into carbonic acid, not the carbon of the sugar is burned, but the replacing hydrogen, and since this hydrogen unites with oxygen in the animal structure to form water, the oxygen replaced in the plant and again supplied by the blood, is restored to its former place. Hence sugar can be burned in two different ways, and converted into carbonic acid—directly when it is made to combine with oxygen at a high temperature, or indirectly by the replacement of its hydrogen by oxygen at lower temperatures. The amount of oxygen is the same in both cases, for fifteen grammes of sugar, sixteen grammes of oxygen are required; but when the work of combustion, which requires the expenditure of heat, is unequal, the heat set free must also be unequal."

Coal Exposed to Air Deteriorates.

The *Scientific American* gives some observations of Dr. Richter upon this subject: "The absorption of oxygen does not cease at any time. If a current of air is passing over a coal heap, large quantities of carbonic acid will be given off; but where the air is quiet, the coal absorbs the carbonic acid and less change is manifest. The temperature of the air has much to do with the deterioration of coal, as warm weather greatly promotes the absorption of oxygen and the formation of carbonic acid. All engineers agree that the influence of moisture is very great. Water operates in various ways; it acts upon the iron pyrites, that in greater or less quantity accompanies all coal, oxidizes the iron, slakes the coal, and thus exposes greater surface to the action of the air, and heats up the mass, so as to promote oxidation. The sulphate of iron in turn oxidizes, and is again reduced by the coal; and it is thought that the green vitriol thus serves as a conveyance of oxygen to the coal, and occasions its combustion."

Prof. Wurtz quotes the article, and adds: "The present writer has long believed that the oxidation and slow combustion, so liable to pass into rapid combustion, of many coals in the air, was due almost, if not altogether, to a secondary agency of the contained pyrites, or rather of the ferric sulphate formed by its oxidation, which acts very appreciably upon the bituminous constituents. This view is a direct corollary from his own *Chemical Theory of Coal Genesis*. [See the *Press* for February 5th.—Ede.] According to this theory, coal together with the accompanying pyrites and ferrous carbonate (iron stones) was produced by metamorphoses of organic matters in water charged with ferrous sulphate. Hence strata containing iron in ferric forms, like red and brown sandstones, seldom carry coal. And when, the product of a ferrous epoch, coal is exposed to an oxidating atmosphere, like our own, ferric sulphate is produced, incompatible with the coal matter."

ARRANGEMENT TO SHOW ELONGATION OF A MAGNETISED BAR.—In a late lecture at the Royal Institution, Prof. Tyndall demonstrated the fact of such elongation by an apparatus described in the *Engineer*: "An iron bar is magnetised by an electro-magnetic helix which surrounds it. Its elongation is first augmented fifty-fold by means of a lever; and this motion is applied to turn the axis of a rotating mirror. From this mirror is reflected a long beam of light, which forms an index without weight. The reflected beam may be caused to print a circle of light upon a white screen, and this circle when the bar is magnetised suffers a displacement due to the elongation of the bar. This displacement may amount to a foot or more. Iron filings scattered on paper placed over a magnet, arrange themselves in lines, which Faraday calls lines of force. Along these lines the filings set their longest dimensions. When a bar is magnetised, its particles in the same manner try to set their longest dimensions parallel to the direction of magnetization; that is, in the direction of the bar itself. They succeed to some extent, and thus produce the lengthening of the bar. Magnetic oxide of iron may be suspended as a powder in water contained in a cylindrical vessel with flat glass ends. Let the vessel be surrounded by a coil of covered wire. Looking at a candle through the muddy liquid, and making the coil part of a voltaic circuit, the candle brightens at the moment the circuit is made. Breaking this circuit, dimness again supervenes. This is due to an arrangement of the particles of suspended oxide similar to that of the iron filings. They set their longest dimension parallel to the beam of light, and thus obstruct its passage less."

A FORMER CONTINENT BETWEEN NORTH AMERICA AND EUROPE.—Prof. J. S. Newberry, in his report on the Cretaceous and Tertiary Plants, says that the large number of identical miocene species leads to the inference that North America and Europe were connected by an intermediate continent. "If this inference should be confirmed by future observations, we should then see how the eocene tropical or entropical flora of Europe was crowded off the stage by the tropical flora of the miocene, which latter accompanying a depression of temperature, had migrated from America, while the eocene flora had retreated south and east, and is now represented by the living Indo-Australian flora, characterized by its *Hakea*, *Dryandra*, *Eucalypti*, etc., etc., which form so conspicuous an element in the eocene flora of Europe." Instances in which the miocene flora occurs on the McKenzie river, Disco Island, Iceland, and the Island of Mull are brought forward to show that this land connection must have occurred to the northward, and that the country was then in possession of a milder climate than now reigns in the same latitude.—*American Naturalist*.

THE CORNELL EXPEDITION.—Prof. Ch. Fred. Hartt, who is to lead the party, and who has already twice visited Brazil on scientific expeditions, describes, at the request of the editors of the *Cornell Era*, the plan of the one now in preparation. We quote a paragraph: "It is my wish on this expedition, with the aid of my large corps of assistants, to make a series of collections of marine animals and examine the coral reefs between the mouth of the Amazon and Pernambuco, with a view, amongst other things, of determining the relation of the marine fauna of Brazil to that of the West Indies, and to determine whether the great equatorial current which splits at Cape St. Roque, part flowing north, part south, has an influence on the distribution of the animals north and south of the Cape. * * The study of the geology and physical geography of Brazil is throwing unexpected light on the structure of North America—for the two Americas are repetitions of one another, and correspond not only in general form, but also in structure, so that we may trace a long series of homologies between them."

A NEW PHOTOMETER.—A photometer, invented by M. Nagant, is based upon the formation of a column of liquid, partially opaque, which may be drawn out until the length is such that the light from an illuminating body ceases to be visible through the liquid. The length of the column which completely obscures the light, starting from the point where the column is thinnest, gives a measure of the intensity of the light under examination.—*Chemical Abstracts*.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, June 25th: The shaft in the upper works of the Schenectady has been freed from water, and sinking will proceed. The lower tunnel is making rapid progress. . . . The Globe is said to be in funds and prepared to erect reduction works. . . . Exchequer Co., near the head of Indian creek, are to purchase the Pioneer mill near Markleville. . . . The two lodest in the Chicago Tunnel show promising quartz. . . . The fire clay used for the melting furnace at the Levisthan did not answer, and the trial run has to be deferred.

AMADOR COUNTY.

NUGGET.—*Ledger*, July 2d: Burt & Head, of Fiddletown, bought a nugget last week that weighed \$525.

CALAVERAS COUNTY.

PALOMO.—*Chronicle*, July 2d: The vein in the 300-foot level shows rock of extraordinary richness, and has widened to 24 feet between the walls. The Palomo will equal, if not surpass, the celebrated Hayward mine in extent and richness. The shaft is sunk 300 feet, a number of levels have been run, the rock from all of which has paid well. The lode increases in width and the ore in richness as the work progresses. We understand that \$3,000 was recently cleaned up after a run of eleven days, with sixteen stamps.

GOOD ROCK.—Mr. Poe, of the Buckeye mine at Independence, informs us that the rock he had crushed at the Petticoat mill paid \$50 per ton. He also had a lot of second-grade crushed in Harris' mill which netted \$24 per ton.

RAILROAD FLAT.—Correspondence of same: Several new claims have been opened. The Burr mill has been constantly running. At present it is crushing rock from the Bald Eagle and the Lewis mine.

EL DORADO COUNTY.

RICH.—*Placerville Democrat*, July 2d: The Pocahontas company, near Logtown, have struck a rich deposit during the past week.

GOLD DUST.—There has been shipped from this city during June, through Wells, Fargo & Co., \$52,394. Besides this there has been taken away by private hands about \$8,000, making a total of \$60,000.

GEORGETOWN.—Correspondence of same: The building of a ditch down this divide has taken a definite shape. I am informed that parties below have sent out men to make a preliminary examination and locate water rights in the mountains above here.

INYO COUNTY.

BULLION.—*Los Angeles News*, 2d: Eight hundred and eighty-two bars of silver and lead bullion, weighing 75,800 pounds, from the Owens river mines, were taken up by the steamer.

NEVADA COUNTY.

GOLDEN RULE.—*Transcript*, June 29th, This ledge, near Columbia Hill, was located last December. An incline was sunk forty feet, the average width being two and a half. The rock shows free gold, and has paid \$30 a ton. A controlling interest is now in the East, and Burns, Secretary, will start East to-morrow, to obtain means to develop the mine.

CHINESE.—On Kanaka creek, from the falls to Allegheny, they fairly swarm. Chinese miners are rapidly increasing on the Middle and South Yuba.

A Chinese company, on Selby Flat, are doing a good business.

We learn that there are over 300 Chinese working on Deer creek, divided into 20 companies. They work four to five months in the year, and the receipts of the different companies range from \$800 to \$3,000. Some own ground, but the majority are working on shares for white owners.

UNION GRAVEL CO.—Same of 30th: This Co., near Columbia Hill, commenced hydraulic mining in February, and have been cleaning up \$5,500 a month. The company obtain their water from the North Bloomfield Co., for which they give a percentage of the gross proceeds.

KENNEBEC.—This company, at Birchville, cleaned up their sluices on Monday and Tuesday, the yield being about \$5,000.

CONSOLIDATED.—Fidelity has made consolidation with Salathiel to secure a mill. The Salathiel engage to take down the mill and put it up on the Fidelity mine for a one-third interest in the same.

STAR.—Same of July 1st: The owners are putting in new batteries and making other improvements in their mill. They expect to have it running in two weeks.

LITTLE YORK.—Mining is reported brisk. Water holds out, and nearly all the claims that have fairly opened have paid well. The cement claims of Brown Brothers have been yielding immensely.

PITTSBURG.—On Wednesday, rock thrown out by a single blast was estimated to contain \$1,500 worth of gold. The gold shows plainly in the ledge, and it is not known how far the pocket may extend.

HARTNEY.—Grass Valley Union, July 1st: This mine has been idle for some time, though its owners have never abandoned it. A few days since a party of miners took out five tons of ore from the backs, and made a crushing. The five tons gave a yield of about \$475.

SULPHURETS.—Same of 2d: We saw at Finley's, yesterday, a cke of gold worth \$1,000, from 16 tons of sulphurets of the Wisconsin mine, worked at Hill's. The sulphurets were second-class, or light sulphurets, caught by Rawlins & Stephens' new machine.

PLACER COUNTY.

ITEMS.—*Stars and Stripes*, June 30th: Warren Reed had 48 tons of quartz crushed at the Empire mill last week, from which was realized \$456. . . . Murray, Clewman & Co. obtained at the rate of \$8 per ton from 2½ tons of rock. . . . S. Dwyer & Co. had four tons crushed which yielded over \$20 per ton. . . . Nineteen tons, from the claim of R. Gordon & Co., yielded \$307. . . . The Good Friday Co. had 5½ tons of refuse rock crushed at the Empire mill, which yielded at the rate of \$32 per ton.

SPLENDID YIELD.—Fred. Schnabel and James Dennis had six tons of rock from the Jack Bryant ledge worked at the Schnabel mill, from which they realized \$300, or \$50 per ton. They have plenty more of the same kind in sight.

SALE.—The Little Corkscrew claim, near Ophir, was sold on Tuesday for \$1,500 cash. Two months ago the price was \$250.

DAMASCUS.—The new tunnel of the Mountain Co. is nearly through, and when completed will measure a mile in length, all through solid bed-rock.

GOLD RUN.—The Miners' Ditch Co. stole a march on the other company, and located the water privilege on the South Yuba during the night. They are making a survey, and will soon commence a ditch bringing in an abundance of water.

STAR ON THE NORTH FORK.—Work will be commenced on the North Fork dam and ditch on the 6th of July. The dam will be 14 feet higher than the old one. Numerous claims, abandoned years ago, that will now pay well, have been taken up.

RATTLESNAKE.—Cor. of same: There is little doing in mining, with the exception of one claim that a Chinese company is starting in good shape. They are to get water from the Bear river ditch. John Duncan sold his discovery to a neighbor, who washed out with a rocker \$25 in one day.

NICE PROPERTY.—The *Herald* of July 2d speaks of the strike made by Schnabel as in the old McByron shaft, and says he owns the land, it having been patented as a farm years ago. He has 2,600 feet of the ledge.

PLUMAS COUNTY.

ITEMS.—*Quincy National*, June 25th: The Indian Valley Co. have struck a very extensive chimney of rich rock in the eastern end of the ledge. . . . J. B. Bachelder, of the Green Mountain ledge, near Round Valley, has gone below for machinery for a mill which he intends putting up near Arlington. . . . Bob Riddle and company, on Soda Bar, have commenced work in earnest. They have purchased the car and fixtures belonging to the Spanish Peak Co., and are running an incline into the flat.

NORTH FORK.—The Dutch Hill claims average \$5 per day. Ferguson & Wagner are making wages. They are bringing a ditch from Ohio creek, which will be 7½ miles in length. Mechlin's pay grit has averaged \$5 per car load. The Crumboys sold the Red Rock diggings to Mr. Davis, of Light's Cañon, for \$600.

SAN DIEGO COUNTY.

Los Angeles telegram, June 28th: One-third of the Washington mine in Julian District was sold for \$55,000.

The Los Angeles *News* of July 2d gives the following as the result of personal observation: The Washington is now idle. It is stated that Bickere has sold to J. T. Gower. Mr. Gower, with 13,000 pounds of rock, has gone to San Francisco. The Owens was discovered in February, and

1,000 feet located. The shaft is down 55 feet. A tunnel has been driven in to strike the shaft at a depth of 110 feet. One hundred and fifty tons of rock have been taken out. The ledge, 2½ feet wide, is well defined, and gradually widens. From this rock the proprietors have, in a mortar, pounded out in a single day \$117 of gold. In our presence 15½ tons of average rock went through the mill, yielding 42 ounces of retorted gold. No specimen rock was crushed. This mine was sold within 36 hours after the above result, and Kelly is now in San Francisco to receive the coin.

The San Diego No. 1, owned by Bailey, Chambers and others, has a shaft 60 feet deep, showing a ledge of 2½ feet. On the dump is 75 tons of rock, much of it showing free gold. The owners claim 1,600 feet. The Hayden was discovered March 4th. The owners, Calkins, Warren and others, have located 1,000 feet. The shaft is down 51 feet, and the dump contains 30 tons of milling rock.

The Good Hope claims a ledge of 2½ feet, and has out 75 tons. A tunnel will be driven in, striking the ledge at 200 feet below the surface. The above are the leads upon which the most work has been done. There are many other locations—some 150 in all. One of Wilson's 2-stamp mills is in active operation. Two more are to be erected. Wood and water are plenty, and rock can be milled cheaply. The only drawback is the attempt to extend the Cuyunmac grant over the mines.

SAN BERNARDINO COUNTY.

THE "JESUIT MINE" FOUND.—*Guardian*, July 2d: Mr. Stamps and party left the San Diego mines three months ago and commenced prospecting this way, taking the mountain ranges with little success, until upon arriving at the mountains of San Jacinto they discovered a small quartz vein three inches wide, but extremely rich. They commenced sinking, and at a depth of 12 feet it was 12 inches. An arastra was erected, and from 600 pounds of rock \$300 worth of gold extracted.

A short time ago some Californians found very rich silver float rock. Dr. Barton and Wm. McCoy, on Sunday last, in company with Chas. Clusker and Mr. Lisle, proceeded to the spot where the rock was found—40 miles easterly from San Bernardino. Clusker struck upon a trail and soon came upon a road, well graded and built of large stones. Following this up, an old shaft was found, partly filled in. The party proceeded to clear away the rubbish, and soon obtained a lot of ore, assaying from \$600 to \$1,000 per ton. This mine has been called the Jesuit, and another close by the Old Padre. A company has been formed, and the district named the San Jacinto. It is believed that this is the traditional mine of the Jesuit Padres.

SHASTA COUNTY.

BIG "SPECIMEN."—*Courier*, July 2d: Four weeks ago, three men from a lower county drove up here in a two-horse wagon containing a partial prospecting outfit. While buying an ax at Coleman's store, they heard some Portuguese talking about Spring creek, three miles from town, and the chances for striking diggings. They concluded to try their luck. They commenced on one of the bars pronounced worked out six years ago. The claim paid fair wages for a few days, but one day last week while one was shoveling gravel up from the bed-rock into the alnices, he took up on his shovel what appeared to be a small rusty boulder. As he was about to toss it aside, his attention was attracted by the unusual weight, and he proceeded to rub the rust off, when it gleamed forth a solid nugget of pure gold, which weighed 15 pounds 4½ ounces—worth \$3,200.

SIERRA COUNTY.

QUARTZ.—*Messenger*, July 2d: A rich quartz discovery is announced at Mount Pleasant, between Gibsonville and Newark. Specimens have been assayed which yielded \$2,000 to the ton.

CLEANED UP.—Ned Leonard cleaned up a few days since, after a run of 12 days, and realized \$1,000.

TRINITY COUNTY.

THE MINES PLAYED OUT.—*Journal*, July 2d: Thursday of last week George Van Maitre found a piece of solid gold weighing eight pounds avoirdupois, in his claim on Little Mule creek, near Minersville. He picked up 18 ounces beside the large piece the same week. J. W. Smiley came across a chunk of gold in his claim below McGillivray's, one day this week, that weighs 11 pounds.

YUBA COUNTY.

WILL INCORPORATE.—*Appeal*, June 29th: The company that have charge of the Dexter mine, in Brown's Valley, and

who have leased the Donnebrogue mill, are going to incorporate. The rock they are now crushing is said to be exceedingly rich.

SMARTSVILLE.—Same of July 3d: Eighty mining claims north of the Smartsville Hydraulic M. Co. have recently consolidated. One hundred and twenty claims to the south of these are taking measures to consolidate. It is intended to run one main tunnel from the Yuba river for a distance of 2,000 feet, and then branch off to the respective claims. The prospects in that section are thought to be more favorable than for many months.

Arizona.

RICH GOLD LEDGES.—The *Elko Independent* publishes a letter dated Martinez mining district, Camp Date creek, June 4th. The writer is endorsed by that journal as a reliable man, and experienced miner. We quote: "There are seven of the richest gold ledges in the world here, all of which have been discovered within the last month, viz: the Queen of Palmyra, Montezuma, Real del Monte, Cornucopia, Buena Vista, Mayflower, and Martinez. The Cornucopia runs 20 feet above the surface for a mile, with gold visible all over it. In the gulch under the ledge 50 cents to the pan is washed out by Mexicans. The ledge is 200 feet wide. The Queen of Palmyra is covered with native gold, and the surrounding dirt yields 75 cents to \$1 per pan. The Martinez was the first ledge discovered by some Mexican hunters. It is rich in gold, and covered with pyrites. Mayflower is full of little cells, crammed with gold as fine as the finest flour, which, by shaking the quartz drops out. One assay from this went \$65,000 to the ton. The Real del Monte crops out 12 feet, and can be traced 5,000 feet on the surface; is full of native gold, and has the honeycomb cells in the quartz filled with fine gold. Wood and water are abundant at the base of the mountain on which the mine is situated. The Montezuma is of the same character as the Martinez. The Buena Vista quartz is very rich. Four arastras have been built, and are turning out from \$3,000 to \$4,000 per week each. None but Mexicans in the district.

Colorado.

ITEMS.—*Central City Register*, June 29th: Jo. Watson has struck a large body of ore in the Brown mine, which yields six hundred ounces of silver per ton. . . . Hussey & Co. shipped \$9,000 worth of gold bullion yesterday. They say the gold yield is increasing steadily. . . . Snyder & Ellingham have sold their lien title to the Niwot property to Davidson and others. The very day of the sale an agent arrived with funds to pay off the company's indebtedness. The Eastern stock-holders will contest Davidson's right to the property. S. & E. have been making \$50 per day for a month out of the mine.

Idaho.

POORMAN.—*Avalanche*, July 2d: A force of 12 men are taking out 100 tons per week from the upper levels.

EMPIRE.—The shaft is 80 feet deep; from the bottom a drift is now in 30 feet, showing 20 inches of fine-looking silver-bearing quartz.

CHIPMUNK.—A Teutonic gentleman owns 500 feet, and has a shaft down 14 feet. The vein is of decomposed quartz only four inches in width, but very rich in gold, with considerable silver. About two tons worked at Trask's arastra yielded \$492. Besides this, nearly \$100 was panned out of the same ore.

The Skookum is above the Chipmunk. Since the 9th of May a shaft has been sunk 40 feet, and a drift started north. The vein is 16 to 20 inches in width, of decomposed quartz, and prospects rich in gold.

On the Mahogany, stoping continues, and considerable rich ore is being taken out. The Peck & Porter shaft is to be completed by the middle of this month. This will afford ventilation for both mines.

GOLDEN CHARIOT.—The fifth level exceeds all expectations. The ledge is fully three feet in width, with the mineral evenly diffused. Silver increases and gold decreases the deeper it is worked. An immense quantity of ore yet remains in the fourth level, and stoping has just commenced in the fifth.

ITEMS.—Rich ore coming out of the fifth level of the Ida Elmore. . . . Work commenced on the first extension south of Morning Star. . . . Messrs. Cogswell and Lacy started on Thursday to work the Pickens & Edwards mine at Cottonwood. Judge Robinson has an 8-foot shaft on his new discovery, showing a nine-inch vein. . . . We have seen some fine specimens of ore from the Keystone. McDaniel & Co. find a 2-foot vein in it.

DOWN THE CREEK.—Herold & Co. have done considerable hydraulic near Happy Camp, and have made good wages. Shuster & Co., in Blue Gulch, have quit piping and are cleaning up. Jordan & McDowell's claims are paying an ounce per day to the hand. The gravel is 10 to 12 feet deep and pays from the top down. They have refused \$3,500 for their diggings. Considerable prospecting has been done, proving that for ten miles below Wagontown, the creek will pay five to ten dollars per day to the hand.

LOON CREEK.—A friend writing from Oro Grande, June 16th, says that the water is very high, the flumes nearly all washed out, and no one at work.

Montana.

DANER'S BAR.—*Helena Gazette*, June 27th: The ditch will be completed and the water running in ten days.

ARGENTA.—Cor. of same: Green Campbell mill starts up again in three weeks. The tunnel is nearly finished. All the astras pay well, and none better than Charles Hinaman's. The Upper Silver Star mill was pounding rock from the Iron Rod lode. Wash. Stapleton's furnace has just been heated up with thirteen tons of metal. It will be kept in full blast all summer. The last run is from the Blue Wing, a very rich lode.

FRENCH GULCH.—Cor. of same: The mining is all done with four or five flumes, with the exception of two companies of Chinamen at the mouth of the gulch. On First Chance, Harris & Eckleson, also Dundee & Gardner, have had rock flumes. On Picayune the Swamp Co. cleaned up 23 ounces for one day's run. Lucky Gulch pays three companies about wages.

Nevada.

COPE DISTRICT.

ITEMS.—Elko Independent, June 29th and July 2d: Ore is being constantly shipped abroad from the Great Eastern. Shaft on the Mammoth is 30 feet deep and has yielded 200 tons of ore worth \$100 per ton. Thirty tons \$75-ore out in Belle of the West. Columbus ore runs from \$400 to \$500 per ton. McDonald & Buneman have the Diamond under bond and are at work on it. Four tons of Great Republic ore worked \$80 per ton. Argenta puts through 17 tons daily; proceeds \$7,000 per week. Besides this the first class ore is shipped abroad and returns from \$600 to \$1,200 per ton. Excelsior is owned by same proprietors with Argenta. So is the Pioneer. Shaft in Jane Arthur is 35 feet deep; 5 tons choice ore out. Virginia has a 75-foot shaft and a 4-foot vein. Mountain City mine has a 70-foot shaft and an 8-foot ledge. Six hundred tons on dumps worth \$65 per ton, and one thousand tons more of same kind in sight.

BRUNO CITY.—Cor. of Elko Chronicle, June 30th: Contracts have been entered into between the Mountain King, Miners' Rest and Chrysopolis companies and the Elko Smelting Works to furnish the latter forty to fifty tons of first-class smelting ore, and a force is now at work on each taking out the metal. The first run of the Elko Smelting Works will probably be made on Bruno ore.

HUMBOLDT.

BUENA VISTA DISTRICT.—*Silver State*, July 1st: Inskip mine has considerable ore out, and prospects are good. Silver Mining Co., on the Arizona ledge, is taking out large quantities of fine rock. The mill is running to its full capacity.

STAR DISTRICT.—Desoto mine is giving out fine shipping ore, besides quantities of second-class. American Basin mine promises to be first-class. Old Sheba is working 25 men and taking out ore, some of which will go \$600 per ton.

SACRAMENTO DISTRICT.—Rochester mine has a fine body of low-grade ore in sight. Harris is sacking splendid ore from a 4-foot ledge.

REESE RIVER.

MANHATTAN.—*Reveille*, June 29th: The mill is now fairly under way, and every part of the new machinery erected in connection with the new Stetefeldt furnace works smoothly. There are in front of the mill probably one hundred tons of ore, which will average \$500 per ton; small lots will work from \$1,000 to \$2,000 per ton; and there is not a pound that will work less than \$250 per ton.

WASHOE.

GOULD & CURRY.—*Enterprise*, July 3d: The ore-producing sections are confined to the upper works, from which 70 tons per day is extracted, most of which is from the El Dorado section. The principal work on the 1,200-foot level is in drifting north.

IMPERIAL EMPIRE.—Receipts from ore worked and sold for year ending May 31st, about to \$180,000.

OCCIDENTAL.—The lower tunnel will connect with the winze from the upper mine about the 14th inst. No increase of water. The erection of the new mill progresses at a satisfactory rate.

JUSTICE AND INDEPENDENT.—Work has been resumed with good prospects. Twelve tons per day are being extracted through an old tunnel.

CROWN POINT.—Daily yield 50 tons of low-grade ore from the upper levels. The winze from the 1,000-foot station is down nearly to the 1,100-foot level. The rock is rather hard.

SIERRA NEVADA.—Billion yield increased.

CHOLLAR POTOSI.—Less than the usual amount of ore extracted during the week owing to want of dump room. Every portion of the mine presents a favorable appearance.

YELLOW JACKET.—The cave which occurred in the 900-foot level on Tuesday last, and resulted in the death of four miners, somewhat retarded work during the week. The damage to the mine was slight.

VIRGINIA CONSOLIDATED.—The drift from the 500-foot station of the new shaft is progressing well, the water having decreased, and the rock is working favorably. It is in over 400 feet. From the upper mine 10 tons per day of good grade ore accumulates on the dump.

BECHER.—Daily yield 25 tons. The upper level resources show falling off. The principal yield is now from the seam above the 262-foot level, which shows improvement.

HALE & NORCROSS.—The daily yield is 235 tons, principally from the lower level.

OPHIR.—The southwest drift No. 2 at the 700 foot level has been cleared of obstructions. It is being driven ahead.

SUTRO TUNNEL.—The Sutr Tunnel was in last evening 1,310 feet, in blue clay and porphyry.

KENTUCK.—Daily yield increased to 40 tons, principally from the upper levels.

CALEDONIA.—Daily yield 40 tons, from the 200-foot level, and the winze has attained a depth of 45 feet. The ore is much improved at this point.

HOPE.—Daily yield 50 tons, keeping both mills running, also the Atlantic.

SACRAMENTO AND MEREDITH.—The work of mine and mill progressing satisfactory.

WHITMAN MINE, CONO.—An assay of ore from a number of points on the croppings yielded at the rate of \$29 per ton, and an assay of ore from a pile of assorted rock at the rate of \$344 per ton. Mr. Crocker, the present owner of the mine, has out over 100 tons of ore.

WHITE PINE.

REVIEW.—*News*, July 4th: Prospects slightly improve. The intrinsic value of our mines is bound in the end to offset the mischief done them at the start by the gutting process. A few weeks of active work, on a scale such as we are now assured of, will bring us out of our slough of despond. The splendid strike of a large, rich, body of ore, in the South Aurora last week, will help. Sales of several partially developed mines, consummated recently in Philadelphia, will also help. The sale of one-half the Eberhardt and all the other partnership properties here, has gone into effect; the drafts drawn, payable on the 1st of July, have been honored; and new life in all the properties will soon be the order of the day.

ITEMS.—The Stanford mill is running night and day on rock from South Aurora. Twenty-five days' run to June 30th, yielded \$57,604. Silver Wave and Silver Wedge are both prosecuting explorations energetically. The Silver Vault Tunnel Co. is in high spirits, and the Anchor Consolidated is in a fine ledge of good ore. The Bowie-Brown has been bonded for \$40,000. The White Pine furnace is in the 35th day of its run. The Co. are building an additional one. The Walsh furnace has been running for several days. The iron water-lining for the Alsop works has arrived. Weiland and the Rathburn smelting works are running on good ores from the western base of White Pine mountain. Voss works shut down. It is probable that the Dayton and Manhattan mills have been purchased by Governor Blasdel, and that in connection with the mills Stetefeldt furnaces will be erected.

BULLION.—The shipment of fine bullion, by Wells Fargo & Co. last week, aggregated \$28,884.64.—\$8,854.86 of which went to New York, and \$20,029.78 to San Francisco.

OUTSIDE DISTRICTS.—The new is satisfactory. Eureka bullion returns from New Jersey will be forwarded immediately. Astonishing developments are making in the Maryland mine, Pinto district. The Social and Steptoe Co. has shut down work

on the Gilligan mine, and is preparing to change its mill to a dry-crusher. It is the intention to erect furnaces on the Stetefeldt plan, and to roast all the ores.

New Mexico.

ELIZABETHTOWN.—Cor. of Santa Fé Post, July 2d: Since Saturday, both Humlung and Grönse Gulch are at work with moderate heads of water. The branch ditch will be finished this week. Dimick Bros. and Mr. Graham have within a few days found the vein in a new place, thirty inches wide and nearly vertical. The prospects are even richer than when first discovered. It is now valuable property.

Wyoming.

SNAKE RIVER.—*Cheyenne Advocate*, June 23d: Just as we go to press we receive intelligence of valuable gold deposits discovered at Gulch. Parties are taking out 13 ounces each, in nine days.

SWEETWATER.—Cor. of same: Work is commenced on the Young America in putting up hoisting works. The same on the east end of the Miner's Delight, by Sneath, Ogden & Co.

The Big Horn Co. are camped on the other side of Atlantic City in Smith's Gulch, and expect to leave for Camp Brown to-morrow. All are in good spirits.

Some of the gulch claims on Rock creek, Meadow Gulch and Strawberry are paying well. Three men took out over \$100 in two days on Strawberry from dry diggings, the dirt of which had to be taken a fourth of a mile in a wheelbarrow for water. Hoisting works on the Cariso are finished, and Mr. Roberts has commenced sinking the main shaft, the ledge improving every foot.

San Francisco Mining Stock Market.

For the period under review, the transactions in mining stocks have been limited, which is principally due to the interruption of business by the adjournment of the Board over the Fourth of July. In reference to the condition of the market during the past six months, which naturally presents itself at this time, we must remark a very great depression in those stocks embraced in the call list of the Board, and that the business of said Board has become more circumscribed—outsiders being less disposed to make ventures—and especially has this been the case the past few months, the dullness of mercantile business generally in no small measure contributing to this result. With regard to the present condition of the Comstock Lode, we note that a number of prominent claims are making very satisfactory returns, to which the present market rate of the stock does not seem to respond. In noting this apparently anomalous state of affairs, we must remember that the plethoric condition of the money market for years prior to the opening of the transcontinental railroad, and the feverish excitement about mines which pervaded the entire Pacific Coast, have brought everything to a more legitimate level, and business is not carried on in that hazardous and liberal manner so proverbial in our past history.

It is a source of mortification to know that the ores of White Pine and of Utah Territory are shipped to Newark, New Jersey, to be melted and refined, instead of coming to this place for the purposes named. It requires from twelve to fourteen days to reach Newark from White Pine, and only four days to reach San Francisco, and the freight is 50 per cent. less than to Newark, yet the preference is given to the latter place, even with the certainty of much loss caused by the jolting of the cars and the sifting through of pulverized ore. This strange anomaly arises from the want of sufficient smelting and reduction works in San Francisco, and should be rectified before it becomes chronic. That facilities should be furnished so very far from the specified mining regions, while this city, located on their very margin, should afford such limited advantages, is certainly a very great want of foresight on the part of our smelters and refiners.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures for the first six months in 1867, 1868, 1869 and 1870:

MONTH.	1867.	1868.	1869.	1870.
January.....	\$7,684,322	\$8,698,934	\$7,964,734	\$3,857,789
February.....	3,303,320	9,716,596	6,918,644	3,139,433
March.....	4,034,293	11,471,530	6,254,145	6,082,596
April.....	5,533,016	12,335,304	7,266,211	5,972,748
May.....	7,551,855	10,162,356	6,991,913	4,538,765
June.....	6,864,765	9,075,082	6,536,337	6,649,730
Totals.....	\$31,113,307	\$51,513,121	\$42,601,984	\$29,847,511

It will be noticed that as compared with the sales during the first six months of 1869, there is a falling off of the present year of more than one-half; but it will be remembered that during the former period an extremely speculative disposition manifested itself during the spring months, swelling the sales to the large sum of \$51,513,121. During the first six months of 1866 the sales were over \$3,000,000 less than the above report for 1870.

CHOLLAR POTOSI.—Continues to sell largely, at rather an improved figure. During the week closing July 1st 1,360 tons of ore were taken from the mine, showing an average assay of \$63.40 per ton. The superintendent reports that the various stopes, now yielding ore, never exhibited a better quality, and each particular section at no time looked more promising. The drifts from the New Shaft also have an encouraging appearance, and up to the date of this report the ore in this section has been found in small lumps, though excellent in quality. A dividend of \$1 per share was paid on the 7th inst. Annual stockholders' meeting, July 11th.

BECHER.—Is not active at present. The bullion returns for the month of June aggregate \$36,048, being

the product of 1,682½ tons, equal to \$21.42 per ton. They are now extracting 25 tons of ore per day from the stopes above the 162 level, and from the stopes 65 feet above the 262 level. They are making a "raise" from the 262 level, south of the shaft, with the expectation of finding a new body of ore.

KENTUCK.—Continues dull of sale at former rates. For the week ending July 1st, 294½ tons of ore were extracted from the mine, yielding \$16.26 to the ton.—**CROWN POINT** sells at a moderate rate, at recent low prices. During the week ending July 1st, 358½ tons of ore were mined, yielding \$4.176 in bullion, equal to \$11.65 per ton.

GOULD AND CURRY.—has been less active, at tolerably well sustained figures. From the Superintendent's report for the week ending July 5th we take the following: In 7th station, crosscut No. 3, four feet have been made through very hard quartz. To the south drift from crosscut "A," 16 feet have been added, running through quartz, clay and porphyry. The south drift, 100 feet above the lower adit, has been extended eleven feet, showing quartz with a little ore. Twenty-one feet have been added to the Potosi drift on the El Dorado level—in quartz and clay. In the southeast drift of the middle adit, 39 feet have been made—quartz and clay; and in the north drift from the El Dorado southwest stope, 24 feet have been made, showing quartz and clay with a little ore. During the week ending July 4th, they extracted 396½ tons of ore, showing an average assay value of \$42.36 per ton.

HALE AND NORCROSS.—is meeting with rather slight sales. The ore extracted during the week ending July 2d amounted to 870½ tons, the entire amount coming from the upper mine. They are repairing the lower works, consequently did not extract any from that locality. A dividend of \$5 per share was paid on the 7th inst.—**OVERMAN** continues quiet. The bullion yield for the month of June is reported to be \$18,700.

OPHIR.—is more active at an advance. For the week ending July 5th we have the following report: In the southwest drift at shaft No. 2, they are getting some lively looking quartz, and the appearances are much more favorable for metal than anything met with in the drifts north. At shaft No. 3, the drift south from the main drift of the first station shows some improvement.

SIERRA NEVADA changed hands to a considerable extent at well maintained rates. The mine is reported to be looking well, however the last clean-up is not as satisfactory as expected. For the two weeks ending June 30th they extracted 600 tons of ore from the ledge and 460 tons from the gravel deposit. During the previous two weeks 810 tons were taken from the gravel deposit.—**EUREKA** (Cal.) disbursed a dividend of \$7.60 per share on the 7th inst.—**SAVAGE** will hold its annual meeting on the 21st inst.—*Commercial Herald*.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Grapes in the Foot-Hills—How to Make them Profitable.

The editor of the Marysville *Appeal* has recently been looking at the foot-hills in the vicinity of Brown's Valley and noting the facilities they present for grape-growing, etc. He found in almost every little valley, vineyards of from one to ten thousand vines, all of which are in a flourishing condition, though generally somewhat neglected. Some of the more extensive growers have erected machinery for the manufacture of wine, built cellars, etc. Two or three distilleries have also been constructed to obtain the further products of the grape; but these enterprises have not been found profitable, and the works are generally neglected and going to decay.

This lack of success in the manufacture of wine, etc., and the total want of a market for the fruit has brought about a general neglect of the vine itself, and is operating to discourage any further planting. Such a result may be expected from the course pursued.

Grape-growing is a very different thing from wine-making. The former may be carried on upon almost any scale, large or small, and requires very little experience, such only as may readily be obtained in one or two seasons. The latter, on the contrary, is one of the most difficult processes in the whole range of manufactures, and no one should expect to meet with success except he has been regularly brought up to the business, and made it his life study.

The Proper Way for Grape-Growers to Pursue is for all in a given neighborhood to either unite on the cooperative system, and erect, at some central point, extensive works, which should be placed under skilled management, where all may take their grapes and receive their pay from the net proceeds in proportion to the number of tons furnished; or secure at such central point the erection of works by capitalists who will buy of them their grapes at an agreed price.

It requires a large number of vines, in any given locality, to sustain a manufactory of a sufficient capacity to make the business profitable. Wine-making in California is no longer an experiment; and there is now but little difficulty in concentrating the requisite capital at any point, where grapes of the proper quality and in sufficient quantity can be obtained. Let growers about Brown's Valley, or any other neighborhood, give up the idea of small and independent manufacturing establishments, and devote their time and means to extending their vineyards, with proper care for the quality of the vines, and they will soon find themselves in a condition to command all the capital they need to make a good home market for their grapes. The reader will find the outline of an enterprise of the kind alluded to in another column, under the head of "An Important Vinicultural Enterprise." Similar enterprises are also in contemplation or progress in Nevada, Amador, and perhaps in other counties. The Anaheim Company in Los Angeles—an unquestioned success—is conducted on the same plan.

By pursuing such a course as here marked out, the foot-hills throughout the entire State, up to an elevation of 2,000 or 2,500 feet above the sea level, may be covered with vines with the fullest assurance of profitable returns. A large proportion of nearly all our mining counties may be thus improved, and from their present state of pecuniary depression may be elevated to the highest condition of

prosperity. The hills are the natural habitat of the vine—mountain grapes and fruit generally is everywhere in California superior to that raised in our great agricultural valleys. Wheat-growing may be overdone. The market for that product is comparatively limited and uncertain; but the product of the vine, when properly manipulated, is as sure of a market as is the hullaion from our mines. The cereals deteriorate with age; while the product of the vine improves at a rate which pays a fair interest on its original value. What we have here said is no mere theory, but sound, practical sense, already proven successful in a mercantile point of view.

An Important Vinicultural Enterprise.

We have already noticed the fact of the contemplated organization of a vinicultural association near Auburn, in Placer county. The *Stars and Stripes* of the 23d ult. says that the proposition is to purchase the Applegate ranch, about twelve miles above Auburn, which consists of 1,840 acres of land, upon which there are already 40,000 vines in bearing—15,000 just coming into bearing, and 75,000 cuttings in nursery, which are rooting finely. Of the bearing vines, there are 10,000 of the most choice varieties.

There is also upon the ranch 700 apple trees, 500 pear, 150 peach, 25 plum, 10 almond, 25 quince trees, and about 25,000 blackberry bushes, a nursery of 8,000 young fruit trees, several thousand mulberry trees, besides numerous ornamental trees and shrubs.

There is a good house upon the place, also cider and wine presses with tanks, barrels, etc., and a general assortment of farming implements, and a large tract of land in miscellaneous culture. It is proposed to set out 100,000 vines annually, until the 1,800 acres are covered. There is land enough and of the best quality to sustain fully one million vines. It is proposed that this place shall be purchased by the new organization, and be made the nucleus of the most extensive wine-making and distilling establishments in the State. The new Johnston distilling process is to be employed. The vineyard is located directly upon the line of the Central Pacific Railroad, and at an elevation of 2,000 feet above tide water.

In addition to working up the grapes raised upon the place, it is also proposed that the works shall be of a capacity sufficient to work up all the grapes which may be produced by outside parties in that vicinity. Careful estimates show that the company can afford to pay for grapes delivered at the works, at the rate of \$20 per ton—a price which will afford more than twice the profit which can ordinarily be realized from wheat culture.

There is here presented the groundwork and start of one of the most promising enterprises on the coast. It is much wiser and better to encourage home enterprises of this kind than to send our money abroad for that which we can profitably produce at home. It is also better to employ and encourage the investment of home capital than to go abroad for it, and thus divide our profit with foreigners.

CURIOUS RESULTS OF STRAWBERRY EXPERIMENTS.—Col. Wilder, the well-known pomologist, who is now on a visit to this State, has probably experimented in the field of strawberry culture more than any other man. In a recent letter to the *Gardener's Monthly*, giving some of the results of his seedling and crossing experiments—curious and otherwise—he says: "But what will you say to the fact that some of the crosses of varieties by the Hautbois are regular mules?"

The farmers of the Sacramento Valley are now in the midst of their harvest. The wheat yield is generally turning out better than was anticipated a few weeks ago.

The Miracle of Plant Growth.

Having described and delineated the marvels of a seed, the mode of its fructification and the conditions under which it may be vivified into active life, we now propose to enter into a brief examination of the "miracle of growth."

All growth, either animal or plant, is made up of vesicles or cells more or less minute. This is one among the many interesting revelations of the microscope. In the orange the cells are so large that they may be distinctly studied with the naked eye. The cells of the apple, tomato or potato may be studied with a very small magnifier. Some microscopic plants of the lower orders consist of single cells; many others of that class, as yeast, the

FIG. 1.

FIG. 2.

mould upon damp walls, cheese, etc., also mushrooms and sea weeds, and the rust and other lights which affect the farmer's crops, are made up of two or three or at most of a very few cells.

These cells are of various forms—round, square, oval, irregular, etc. Fig. 1 represents groups of different yeast cells; Fig. 2, the cells of an apple; Fig. 3, a section of a potato top, the cells of which increase outward like a tree.

The Structure of the Cell.

By the aid of the microscope we are also able to learn something of the internal structure and growth of the cell. Fig. 4 represents a single cell of an artichoke magnified about 230 times. The straight enclosing lines represent a section of the walls of the cell. These cells are filled with a somewhat viscid liquid, termed

FIG. 3.

protoplasm, by which the process of further cell growth is carried on, and near the center of which may be observed a round body, somewhat denser than the surrounding liquid, and from which lines of similar density are seen to radiate. This is called the nucleus of the cell. At the center of this body is seen still another nucleus just forming. This latter, when examined with a high magnifying power, is seen to contain a great number of minute granules floating in the contained protoplasm. This

FIG. 4.

protoplasm forms the circulating sap of the plant, which in the living part thereof is constantly at work building up new cells, in many-celled plants, and in adding to the number of the plants in single-celled growth. Thus cells are produced one from another, and that action is what we call growth.

This work of cell-building or plant growth may truly be termed a miraculous one—one that surpasses all human philosophy. The following eloquent extract upon the "Miracle of Plant Growth," from the pen of Rev. Edward White, of London, England, will well repay for a perusal in this connection:

Suppose we could watch the grain of corn beneath the soil, when it begins to strike, with an enormous microscope, so that the grain should appear ten thousand times larger than it is, so that we could perceive the movement of the small particles which compose it, we should then see the swelling of the germ that lies hid in the damp earth, and the gradual shooting out of those filaments which are to form the root and blade. It grows larger every day, and requires, therefore, new

substance. But whence comes this substance? From the air, from the water, from the earth. Air particles, water particles, earth particles, have been drawn from around, under the stimulus of the sunbeams and the warmth of the earth's bed, and they have been changed into corn-root and corn-leaf particles, and have become alive, full of a power of drawing and changing other particles from the earth and air in the same manner. It is as wonderful as if an iron seed had struck out and had gathered from around lumps of clay, or pieces of wood, changed them into iron, steel, and copper, and built them up into the form of a steam engine with its complicated metallic fixtures and appurtenances. All is incomprehensible. This, then, is most wonderful—the gathering of the new materials, and change of the air, water, gas, and the earth's flint and salt into the substance of a wheat stalk with its straw and chaff and flour.

But more wonderful still is that other miracle, the arranging of the new particles in a pattern according to a plan, and that plan the plan of an organized structure, loaded at the top with food for mankind.

... Suppose we could see this process magnified so that the particles should seem as large as marbles... if a million variously colored marbles could be thrown upon the ground, and we should see them building themselves up into the pattern of a tree—its stem, its leaves, its flowers, its fruit, we should say, as we watch the process, why, they are alive, and each of them seems to have sense, to know where to go and where to stay, as if each one comprehended the whole pattern, and saw where his place ought to be. But no; they cannot have this sense. When soldiers form in line, or in square, in wedge, in circle, in echelon, or move quickly or slowly, according to command, this is because each man is intelligent, each unit has a mind. But each of these marbles surely has not a mind; yet it acts as if it had; takes up its place, or moves according to the necessity of the general plan of the flower. How is this?... There must be some power distinct from the force possessed by each particle, and superior to all, which directs the movements of each, so as to bring out the predestined figure, as the general in command directs the movements of every soldier on the field. What is this power? You say it is life; yes, that is a beautiful word—but it means nothing, unless it means pattern-forming mind. These wonders conduct us by a very short process of reasoning to a spirit of life which is a spirit of thought, of order, and of power—the all-pervading Spirit of God, who "maketh the grass to grow upon the mountains," who "so clothes the grass of the field," and who thus "openeth His hand and satisfieth the desire of every living thing." It is not, then, a piece of poetry, but profoundest truth, when we say that it is God who "giveth food to all flesh," and whose "mercy endureth forever." He who gave the manna gives the corn. And he who would not acknowledge God in nature would not have acknowledged Him even if he had seen the manna lying like a broad wreath of driven snow around the camp of Israel.

STRAWBERRIES AND ONIONS.—From eighteen acres of strawberries, newly planted, Mr. Gamhart, of San José, cleared last year \$1,500. This year the spring frosts nearly destroyed the first crop; but he will realize about \$3,000. He irrigates very thoroughly, and says that it will pay to irrigate for strawberries. Mr. G. is also raising a fine crop of onions among his strawberry plants, which, he maintains, will be a clear profit. This is the same gentleman whose success in silk-growing is elsewhere noticed in our columns to-day by our agricultural correspondent.

OUR FRUIT MARKET is fast approaching its glory. The fragrant and tempting consignments from the country are a delight to all, and especially to our Eastern visitors. In addition to the small fruits, we have already the apricot in profusion. Apples are beginning to make their appearance, while the luscious peach is also coming in, fresh and juicy, to be quickly supplemented by pears and apples in abundance. The grape, too—California's fruit, *par excellence*—must not be forgotten. It will soon be here, in all its purple freshness, to crown the market.

GRASSHOPPERS are damaging the crops in Powder River Valley, Oregon.

Agricultural Notes from the California Press.

The gopher law, passed by the last legislature, appears to be working well for the destruction of gophers and squirrels. The destruction of these vermin in Alameda, San Mateo, Santa Clara and Contra Costa counties, has already been immense. Up to the 13th of last month hounties had been paid upon the scalps of 672 gophers and 46,700 squirrels in the latter county alone. The Alameda Farmers' Club recommends the following methods of poisoning these vermin as more efficient than any other:

Take two teacups full of wheat, place in a vessel and cover with water, then boil until the water is all absorbed; take a common size bottle of strychnine and pulverize the contents well; take the wheat while warm, make a layer, then add a layer of strychnine, a layer of wheat, and so on, until all is used; to this add brown sugar to well sweeten it; then a little flour or cornmeal; mix all up so as to form a paste. To each squirrel hole put three or four grains only of the wheat.

SUGAR BEET CULTURE.—The interest in the sugar beet growing is constantly increasing. Numerous parties are preparing to enter upon this culture. All fears of any possible failures in the enterprise of making sugar from beets in this State seem to have been set aside. The *Monterey Republican* says that Flint, Bixby & Co. will plant 1,000 acres with beets, and erect a mill, near San Juan. The *Pajaronian* gives some good reasons why the sugar beet culture ought to do well in the Pajaro Valley. Some experiments there have resulted in a yield at the rate of 174 tons to the acre! It is claimed that the expense of cultivating beets there need not exceed \$20 per acre. This, at \$2 per ton—certainly a very low price—would give a net yield to the acre of \$328. This yield may have been an exceptional one, and probably was, as it was confined to a few rods of ground only; but we can afford to divide it by two, or even four. It at least adds another illustration to the extraordinary possibilities of this State in the culture of roots generally—a part of husbandry sadly neglected here, and to which we shall take an early opportunity to refer at length.

CURRENT SLIPS—DECEPTION.—Complaint is made by several fruit-growers, at and about Haywards, that they have been badly deceived in the purchase of currant slips. It appears that some two years ago a large number of slips were purchased, at a high price, on the representation of their being the "cherry currant;" but which on coming to bearing, this season, turned out to be nothing but the common red currant. Thus two years' of cultivation have been added to the expense of purchase, to say nothing about the vexation, delay, etc.

AN INDIGENOUS PICKLE.—A correspondent of the *Petaluma Journal* speaks of the marsh camphire (*salicornia herbacea*) as growing in the salt marshes about Petaluma creek. This plant is largely used in the Eastern States and Europe for pickling. It makes a pickle equal to a crispy bean, and is much prized. The plant is leafless, with cylindrical, pointed branches. The proper season for gathering is early in the spring. It is now getting to be tough and wiry.

CHERRIES IN THE MOUNTAINS.—The *Nevada Transcript* says that John Thirwell, of that city, has sold this season \$100 worth of cherries grown on three trees at his place. One of the three trees produced \$50 worth. Mr. Rogers has also sold several hundred dollars worth from a few trees on his place, producing early varieties.

DRYING UP.—Many of the artesian wells in Santa Clara county sunk for irrigating purposes are said to have dried up, but that the vines and fruit trees which they were intended to moisten have become so

well and deeply rooted that they now stand in but little or no need of irrigation, so that the loss of water works no serious injury.

GREAT YIELD OF WHEAT.—It is stated that Mr. Gasbar, of Knight's Landing, has just harvested 70 tons of wheat from twenty-one acres; and that from land which has produced full crops for six or seven successive years. This is certainly a most extraordinary yield—111 bushels to the acre. Has that yield been exceeded?

The crops in the foot-hills, according to the *Folsom Telegraph*, this season bid fair to be larger and better than ever before known. The wheat, rye, barley and hay crop never has been better, and the vineyards and orchards are in splendid condition.

QUICK WORK.—The *Marysville Appeal* says that Mr. S. Rice, of Sutter county, recently cut, threshed, and took to Marysville, forty-seven acres of wheat—all the same day!

Silk Growing in Santa Clara County.

Mr. L. Gambert, of East San José, has recently been awarded a premium of \$250 by the State for his silk plantation. He has 5,000 trees planted as standards, besides 10,000 more in nursery, two and three years old, valued at \$10 and \$15 per hundred. He cultivates the Italian variety, called the *Moretti*, which he claims to be the best for silk. He has been breeding silk-worms for the past two years. His wife has charge of this department and has met with the most encouraging success. Much credit is due to Mrs. Gambert for the attention and interest given to this enterprise. Her example is a worthy one. Seventy ounces of eggs, worth \$8 per ounce, was the product of last year's "experiment." The lady did all the work of feeding and tending them herself. This year they are hatching 3½ ounces of eggs, that will yield about 140,000 worms, and which in turn will produce 460 ounces of eggs worth \$3.60.

One hundred and fifty female cocoons will produce an ounce of eggs. As one-half are always of the opposite sex, it is reckoned at 300 cocoons for an ounce. Mr. G. says that his worms are all of the best French variety.

He will depend upon orders from Europe for a market, and intends to ship the cocoons, which he says will bear transportation with perfect safety. The Japanese varieties, he says, will not do so well, and are not worth one-third as much as the French worms, which will produce the strongest and the best silk.

At the time of my visit, there was a fine lot of new cocoons perfected, and more worms busy coiling themselves in shingles of silk; while some tiny ones, just hatched, clustered thickly upon the tender leaves spread for their pasture.

A New Hatch of Worms

Is fed upon the tenderest leaves. The tip ends of growing side shoots are clipped from the trees for this purpose. After they get stronger, larger leaves are used, while the full-grown worms require the strongest food.

The worms are fed upon shelves, arranged as appears convenient. The leaves are systematically strewn upon these in the form of a ring or wreath, about a foot in diameter. This method is found to be the best for cleanliness and ventilation. While feeding, the worms all keep upon the top of the leaves. By running a wire fork through and raising the top of the pile, with the worms, the refuse beneath may be quickly removed. Cleanliness and ventilation are considered very essential to success.

Other Silk Growers.

There are several other parties in Santa Clara county engaged in the culture of mulberry trees, and silk worms, more or less extensively. It is maintained that the favorable conditions of climate there are unequalled anywhere. A climate subject to sudden radical changes of dampness and dryness, of heat and cold, etc., is not favorable. But even temperature—neither too moist nor too dry, is essential. I am constrained to think that there are sheltered places among the coast ranges of hills superior in this respect to any that can be found elsewhere.

S. H. HERRING.

What I Know of Farming—No. 25.

More about Apple-trees.

In my opinion, apple-trees, in most orchards, are planted too far apart and allowed to grow taller and spread their limbs more widely than is profitable. I judge that a pruner or picker should be able to reach the topmost twig of a tree with a ten-foot pole, and that no limb should be allowed to extend more than eight feet from the trunk whence it springs. Our autumnal equinox occurs before our apples are generally ripe for harvest, and, finding our best trees bending under a heavy burden of fruit, its fierce gales are apt to make bad work with trees as well as apples. The best tree I had, with several others, was thus ruined by an equinoctial tempest a few years since. Barren trees escape unharmed, while those heavily laden with large fruit are wrenched and twisted into fragments. And, even apart from this peril, a hundred weight of fruit at or near the extremity of limbs which extend ten or twelve feet horizontally from the trunk, tax and strain a tree more than four times that weight growing within four or five feet of the trunk, and on limbs that maintain a semi-erect position. I diffidently suggest, therefore, that no apple-tree be allowed to exceed fifteen feet in height, nor to send a limb more than eight feet from its trunk, and that trees be set (diamond-fashion) twenty-four feet apart each way, instead of thirty-two, as some of mine were. I judge that the larger number of trees (72 per acre) will produce more fruit in the average than the larger but fewer trees grown on squares of two by two rods to each, that they will thrive and bear longer, and that not one will be destroyed or seriously harmed by winds where a dozen would if allowed to grow as high and spread as far as they could.

Every apple-tree should be pruned each year of its life: that is, it should be carefully examined with intent to prune if that be found necessary. It should be pruned with a careful eye to giving it the proper shape, which, from the point where it first forks upward, should be that of a tee-cup, very nearly. I have seen young trees so malformed that they could never bear fruit enough to render them profitable. And the pruning should be so carefully, judiciously done from the outset that no wood two years old should ever be cut away. With old, malformed, diseased, worm-eaten, decayed trees, the best must be done that can be; but he who, pruning a tree that he set and has hitherto cared for, finds himself obliged to cut off a limb thicker than his thumb, may justly suspect himself of lacking a mastery of the art of fruit-growing.

Sprouts from the root of an apple-tree remind me of children who habitually play truant or are kept out of school. They not merely can never come to good, but they are a nuisance to the neighborhood and bring reproach on the community.

The apple-grower should never forget that every producer needs to be fed in proportion to his product. If a cow gives twenty quarts of milk per day, she needs more grass or other food than if she gave but two quarts; and an acre of orchard that yields a hundred barrels of apples per annum needs something given to the soil to balance the draft made upon it. Nature offers us good bargains, but she does not trust and will not be cheated. When she offers a bushel of corn for a bushel of dirty salt, shell, lime, or wood ashes, a load of hay for a load of muck, we ought not to stint the measure, but pay her demand ungrudgingly.

And now a last work on insects.

My township (Newcastle) is said to have formerly grown more apples per annum than any other township in the United States; its apple-trees are still as numerous as ever, but their product has fallen off deplorably. I estimate the average yield of the last three years at less than a bushel per annum for each full-grown tree; I think a majority of the trees have not borne a bushel each in all these three years. Unseasonable frosts, storms, etc., have borne the blame of the barrenness—perhaps justly, if we consider only immediate causes—but the caterpillar and other vermin are, in my view, our more potent, though remoter, afflictions. Not less than four times within the last sixteen years have our trees been covered with nests and worms; and I have seen whole orchards stripped of nearly every leaf till they were as bare (of everything but caterpillars) in July as they should have been in December. After the scourge had passed the trees reclothed themselves with

leaves, but they grew old under that visitation faster in one year than they would have done in ten of healthy fruit-bearing; and they are now prematurely gray and moss-covered because of the terrible infliction.

I lay down the general proposition that no man who harbors caterpillars has any moral right to apples—that each grower should be required to make his choice between them. Slovenly farmers say, "O there is so many of them that I cannot kill half so fast as they multiply." Then, I say, cut down and burn up the trees you can best spare, until you have no more left than you can keep clear of worms.

If it were the law of the land that whoever allowed caterpillars to nest and breed in his fruit-trees should pay a heavy fine for each nest, we should soon be comparatively clear of the scourges. In the absence of such salutary regulation, one man fights them with persistent resolution, only to see his orchard again and again invaded and ravaged by the pests hatched and harbored by his careless neighbors. He thus pays and repays the penalty of others' negligence and misdoing until, discouraged and demoralized, he abandons the hopeless struggle, and thenceforth repels the enemy from a few favorite trees around his dwelling, and surrenders his orchard to its fate. Thus bad laws (or no laws) are constantly making bad farmers. The birds that would help us make head against our insect foes are slaughtered by reckless boys—many of them big enough to know better—and our perils and losses from enemies who would be contemptible if their numbers did not render them formidable, increase from year to year. We must change all this; and the first requisite of our situation is a firm alliance of the entire farming and fruit-growing interest defensive as to birds, offensive toward their destroyers, and toward the vermin multiplied and shielded by the ruthless massacre of our feathered tribe.—*Horace Greeley.*

AN AMERICAN AGRICULTURAL WRITER COMPLIMENTED.—X. A. Willard, one of the editors of the *Rural New-Yorker*, has been honored with an invitation to contribute an article on American butter factories, for the *Journal of the Royal Agricultural Society of England*, of which the Prince of Wales is President. John Bull is not often wont to go out of his own dominions to seek for information, especially on agriculture. This request is considered quite complimentary, and besides Johnny pays well—two guineas per note page of manuscript.

THE GRAPE CULTURE.—The number of grape vines under cultivation in this State during the year 1868 was set down, officially, at 22,405,580. The increase for 1869 and 1870 must very materially swell this already large reported aggregate.

Notices to Correspondents.

C. E. G., Carlin.—There is almost no demand for antimony in this market and it is not quoted. It is worth perhaps 8 to 10 cents. If your ledge will work 80 per cent. of metallic antimony, it will probably pay you and at the same time astonish us. Stibnite, sulphuret of antimony, the common ore, holds about 73 per cent. of metal. The rare oxides hold as much as 84 per cent.

CROWQUILL.—Will appear next week.

Guess Again.

We see that the arrival of a cargo of "tin clippings" for a copper mine at Hog Hill, Calaveras county, has set the people of Stockton at work cudgelling their brains as to the purpose for which this article is intended. Many bright ideas have been etched out, and are recorded in a Stockton paper, whose article on the subject is now going the rounds. It is for manufacturing bronze, or bell-metal, or Britannia, or various other alloys of copper and tin, or else (brightest and best) it is to form an ingredient of the flux of some mysterious smelting process.

There is considerable ingenuity shown in these conjectures, and not a small degree of originality. As people there are so fond of guessing, will not some one give them another chance for further interesting conjectures, by insinuating that "tin clippings" are composed principally of iron? This will open another field for inquiry.

WAR IN EUROPE.—There are symptoms of an approaching conflict between France and Prussia. Spain wants to have a Prussian prince as King. This is unpleasant to France, but is favored by Prussia. France threatens that there will be an unpleasantness if Prussia does not stop. If a war does occur, it will be a hot one.

THE LAST MEXICAN FLAG which floated in this city when acquired by the United States has been presented to the Society of California Pioneers, by Don Rafael Pinto, at the time referred to a Custom House officer.

Eureka District, Nevada.

We have lately received a call from Mr. Jos. Corwin, of this district, and have been shown a private letter from another gentleman now engaged in smelting at Eureka, Nevada. From these two sources we have received considerable information which will be of interest to many of our readers. Eureka is situated about 70 miles from Palisade station on the Central Pacific Railroad. The general formation is limestone and sandstone, with deposits, some very large, of carbonate of lead. The ore is represented as much richer than the base metal ore of White Pine, and the facilities for smelting are said to be very fine, plenty of wood and water, splendid sandstone and marl for the furnaces. The district contains perhaps about a thousand inhabitants, and the town some six or seven hundred.

One of the most noted mines here is the Champion, owned by Messrs. Bateman and Buel. This is represented as an immense body of ore. Next to this is the Buckeye, which has been bought within a few days by a San Francisco company (the Eureka Consolidated?). This is consolidated with the Champion and with Buel's smelting works, and has the brightest of prospects. It is stated that \$100,000 was given for the mine, and \$12,000 paid Bateman and Buel for their share (one-half) in the furnaces.

There are six smelting works at Eureka: The Buel, which has two furnaces, each working daily thirteen tons of ore, and producing about seven tons of bullion, holding \$140 to \$180 in silver, and \$120 to \$160 in gold. For a long time the average was \$300 per ton. The owners (or part owners) of these works bought the Champion mine for \$20,000. The Philadelphia Company have two iron furnaces, which has not yet started. Robbins has an iron furnace, with fire-proof brick lining, which was put in operation about the middle of May. McCoy's furnace has recently been put in operation, and is run by Mr. McGee and Mr. Carpenter, formerly of the Alsop works at White Pine. The Wilson furnace, transferred to Goodwin, has been running on ore from the Jackson mine and doing well. McNevin's furnace is not yet finished.

The ore at the town is principally smelting ore, but there is good milling rock in the district. Mr. Corwin brought us some specimens of his ledge at Secret Cañon, about eight miles from the town. Here Messrs. Paige and Corwin have a ledge, which, according to what we have seen, must be rich. The rock is considerably decomposed, and on one piece there was a large number of small, but fine, crystals of chloride of silver. There is also an abundance of what appears to be argentiferous fahl ore, mixed perhaps with other ore. There seems to be scales of chalcophyllite on the specimen, besides other interesting minerals. Mr. Corwin showed us certificates of working results at the Manhattan mill, Austin. Three lots of from 6,500 to 21,000 pounds yielded respectively \$525, \$538 and \$555 per ton. Mr. C. has now brought a lot to this city for treatment, and has promised to give us the results of the assay and of the workings as soon as obtained.

At Pinto, in Eureka district, the ore is represented as differing from that of Eureka and of the last locality, being an intermediate class, so to speak.

WE are informed that Mr. A. P. Klint, of the Museum of the Natural History of the Netherlands, H. Van der Heust, and Z. A. Drechsler, now in this city, are about to start on a trip up the Columbia river, to Alaska, etc., collecting specimens for the above named museum.

PETROLEUM EXCITEMENT.—Another oil excitement exists at West Hickory, Penn., and there is a rush thither.

Our Home Industries.

Manufacture of Preserves.

California is noted for the abundance and excellence of its fruits. It might then surprise a stranger to find so large an amount of preserved fruit in our State. But this amount has been gradually decreasing, and, it is believed, our home manufactures will, in a year or two, drive the imported article entirely out of this market, if not from others.

We have previously spoken of establishments engaged in this business. This week we visited the house of P. D. Code & Co., 621 and 623 Front street. Mr. Code, who has been engaged in the business for years—at Hamilton (Canada West), at Chicago, and at Corinth—was formerly on Stevenson and on Jessie streets. This spring, however, he enlarged his business, took in another partner, and removed to his more favorable location on Front street.

In the upper story of this building are the rooms for making the cans, putting on the labels, etc. The labels are made at the East, and are very neat specimens of art. In the story below, in the rear, is the room where the culinary operations are carried on, and whence a most delicious fragrance was issuing at the time of our visit. Here are two copper kettles for boiling the jellies, and a large tank or vat where the tin cans holding the vegetables, etc., are kept in boiling water. The steam used in the kettles and tanks is generated in a boiler just outside of the building, and thence conducted to where it is used; finally the extra steam is condensed and furnishes hot water for washing purposes. In the cellar we saw a large number of barrels and casks for the pickles.

The number of workmen here employed varies from ten to sixty, according to the season of the year. The firm is able with the present accommodations to turn out now a hundred dozen cans of jelly and three or four thousand cans of preserved fruit and the like daily.

One of their great specialties is lemon jelly. The making of this has been worked up carefully by Mr. Code, and our organs of taste have convinced us that this product is a great success. Unfortunately not enough of the lemon is brought into the market here, so that their supply is at present rather limited; but they are taking steps to procure a sufficient amount in the future. Another specialty is the green turtle put up by P. M. Scooffy, of Guaymas, and for which Messrs. Code & Co. are agents. All the fruits and vegetables are carefully selected before they are put up, and only the best ingredients are used.

Our preserve manufactures are directly subservient to the agricultural interests in so far as they open a larger market for fruits, vegetables and the like. There can be no doubt of the greater extension of this business with the greater advantages our State offers, and as we ship now fresh fruits to Eastern cities, so it is probable that ere long we shall ship the preserved article.

Foundry Works—The Miners'.

The Miners' Foundry is now engaged in the construction of four of Sevrance and Holt's Diamond Drills. These drills are attached to 15-horse power portable engines, and are constructed of a size to bore from two to six-inch holes, at depths from 100 to 2,000 feet, either perpendicular, for artesian wells, or horizontal, or at any desired angle for prospecting purposes.

One of the drills now being built as above, it is expected, will be sent to the new Harpending mines, in New Mexico; one is going to Mount Diablo, to be employed to bore some 500 feet to strike and prospect a coal seam, which it is expected to find at a given point; a third will go to

San Rafael to be employed in sinking artesian wells; the fourth will be retained, for the present, at the Miners' Foundry, in this city, where it will be open to the inspection of such parties as may be curious or interested in examining into the principles and mechanism of this new drill.

This drill will be held in readiness for any employment in this city or neighborhood. One of these drills is now employed in White Pine, and another at Carson Hill, near Angel's Camp, Calaveras county.

In addition to this work at the Miners', we noticed large quantities of miscellaneous work underway, among which we may mention an order for three miles of gas-pipe for the Salem, Oregon, Gas Works. This foundry has also just shipped an engine, pump and hoisting works for a mining company in Sierra county, which is to be employed at the end of a tunnel 1,700 long, to raise water and gravel up an incline 140 feet.

They also shipped, a few days since, an engine, boiler and casting for a smelting furnace to be erected at Oreana, where work is again to be commenced; also, by the last down steamer, a small prospecting mill for the new mines recently discovered near San Diego. Foundry work in San Francisco is very dull at the present time, but the Miners' Coöperative Association seems to be getting a fair amount of what is being done.

Starch Manufacture.

We have now a starch factory in this city. There has existed one in our immediate neighborhood—at Oakland—for some time. But the only one in San Francisco is the San Francisco Starch Works, situated at the corner of Eighth and Brannan streets. This commenced operations only on the first of last month, and they have not as yet put any of their productions in the market. Indeed they have not yet fairly begun on the patent process, which, they claim, shortens and cheapens the manufacture considerably, while producing a superior article. They intend adding to the buildings and increasing their capacity until they are able to produce three tons of starch daily. The firm is W. J. Lavery & Co.

LATBOBE, EL DORADO COUNTY.—On the ranch of Mr. W. W. Faber, and about one and a half miles from the Placerville and Sacramento railroad, is a ledge from which we were this week shown some very fine gold specimens. The ledge runs north and south and dips about 45 degrees to the east. It is supposed to be a continuation of the Sugar Loaf ledge, about a mile off, where the vein has been worked and ore enough extracted to keep a 5-stamp mill running. Indeed, five more stamps are to be erected shortly. The specimens which Mr. Faber showed us were taken from this shaft at a depth of 65 feet. Here the vein is 16 inches wide, while at the surface it was only 6 inches wide. One of the pieces of rock was exceedingly rich and very fine. Mr. F. has a patent from the United States for his land. The finding of this ledge is but one of the indications of how little we yet know of our mineral resources.

THE FIRE AT CONSTANTINOPLE was much more disastrous than the first reports gave reason to think. The fire, which originated in a wooden house, spread quickly over a very large extent of ground. Some ten thousand houses are said to have been destroyed, and the loss of property is estimated at \$25,000,000. The high wind prevailing caused the flames to spread so rapidly that there was a fearful destruction of life, some one thousand (or, as other accounts say, two thousand) men, women and children being burned to death. The fire commenced at noon, June 5th, and lasted till the next morning.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JUNE 28TH.

BELT-BUCKLE.—Israel Alexander, San Francisco.

SEAT FOR VEHICLES.—Porcius Festus Dean, Watsonville, Cal.

CLOTHES-PIN.—George K. Farrington, Alcatraz Island, Cal.

MEDICAL COMPOUND.—George C. Furber, Yreka, Cal.

PLUTINO MACHINE.—Mary P. Carpenter, San Francisco.

REISSUE.

COTTON-GIN.—John C. Du Bois, Millerton, Cal., assignee of John Du Bois.—Patent No. 20,051, dated April 27th, 1858.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

A Patent Broom.

There is now in our office a broom, which the natural curiosity of our visitors leads them to take up, examine and try, and which invariably causes very complimentary comments as to its elasticity and efficiency. This is the so-called "Silver's Elastic Broom." It is a simple device for rendering elastic, durable and easily renewable a very common article of the household.

The essential parts of this invention will be understood from the accompanying cut. They are the cap, D, which is quite re-

markable as a piece of mechanical ingenuity, being stamped from a single piece of brass, and hence without seam; and the wrought-iron loop, E, which screws into the handle. In making the broom, the stalks of the broom corn are slightly moistened, then shaved and placed in the loop, as shown at A. By shaving the stalks thin a large broom can be made, and a light one by leaving them thick. When a sufficient number have been placed in the loop, the cap, D, is put on, and the loop screwed into the handle. The complete broom (with the ferrule on the handle) is shown at C.

By this arrangement the easily-broken twine and wire of the common broom are not necessary, and much greater durability in these and other obvious points is secured. The metallic parts will last for years, and when the brush is worn out it can be replaced at a trifling cost. People in the country, where they can raise their own broom corn, can easily refill them themselves. Those in cities, where broom factories exist, can have them refilled at a very small price. The method of constructing the broom gives it great elasticity; and hence while it lasts longer it will sweep with less effort, and, therefore, wear the carpet much less than the common article.

This invention has received the first premium at several State fairs, and testimonials from many sources. A comparison of the one sent us with the common article previously used in our office, was favorable in every respect to the "Silver broom."

The right for California and Nevada is owned by D. B. Rickey & Co., 111 and 113 Davis street, S. F., where any further information may be obtained.

The Solar Spectrum.

Modern investigations have revealed the interesting and quite remarkable fact that there are invisible, as well as visible, rays proceeding from the sun. For many years—a century or more—after it was known that the prism would separate the rays of light, it was supposed that there were but three prismatic colors—red, yellow and blue; and that these, by overlapping, formed the intermediate colors—orange, green and violet. It finally came to be admitted that the three latter were also primary colors—making six in all; white and black not being recognized as colors, for the reason that white reflected all the colors without separating them, while black absorbed them all.

Newton was the first to explain the cause of the colors of the spectrum—showing that white light, which showed no color, was thereby divided, as it were, into six

The New Mining Bill.

An Act to amend "an Act granting the right of way to ditch and canal owners over the public lands, and for other purposes."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Act granting the right of way to ditch and canal owners over the public lands, and for other purposes, approved July twenty-six, eighteen hundred and sixty-six, be, and the same is hereby, amended by adding thereto the following additional sections, numbered twelve, thirteen, fourteen, fifteen, sixteen and seventeen, respectively, which shall hereafter constitute and form a part of the aforesaid Act.

SECTION 12. And be it further enacted, That claims usually called "placers," including all forms of deposit, excepting veins of quartz, or other rock in place, shall be subject to entry and patent under this Act, under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims: Provided, That where the lands have been

parts, each part having a definite, fixed color, and hence that there must be that number of different kinds of rays coming from the sun.

Later experimenters, in endeavoring, by the use of the thermometer, to find out whether there was any difference in the temperature of the different rays or colors, very unexpectedly discovered not only that such difference did exist, but that there were other rays, separated by the prism, some of which were more refracted than the violet, and others less than the red. These rays were, however, invisible—that is, not colored. It was, moreover, discovered that the rays most refracted (shown in the engraving above the violet) were probably chemical rays, and totally devoid of heat; while those least refracted (shown below the red) were merely calorific, without color or chemical action. In fact, it was by noticing that chemical action without heat took place in the one, while heat without chemical action was developed in the other that these rays were discovered.

By passing a thermometer slowly downward, through the series of rays, as herewith shown, no effect will be perceived upon it until it enters the violet, when in its further passage it will continue to rise higher and higher, until it leaves the bounds of the invisible, calorific rays, represented in the lower portion of the engraving, where it again relapses to the average temperature of the room in which the experiments are being conducted. The chemical rays commence with the blue, extending upwards. The calorific commence with the violet and extend downward. Thus there are three spectra—chemical, luminous and calorific.

THE average daily consumption of Cochituate water in Boston the last year was 15,080,400 gallons, being an increase over the previous year of 301,233 gallons.

previously surveyed by the United States, the entry in its exterior limits shall conform to the legal subdivisions of the public lands, no further survey or plat in such case being required, and the lands may be paid for at the rate of two dollars and fifty cents per acre: Provided further, That legal subdivisions of forty acres may be subdivided into ten-acre tracts; and that two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres each, may make joint entry thereof: And provided further, That no location of a placer claim hereafter made shall exceed shall conform to the United States surveys, one hundred and sixty acres for any one person or associations of persons, which location and nothing in this section contained shall defeat or impair any bona fide pre-emption or homestead claim upon agricultural land, or authorize the sale of the improvements of any bona fide settler to any purchaser.

SEC. 13. And be it further enacted, That where said person, or association, they and their grantors, shall have held and worked their said claims for a period equal to the time prescribed by the statute of limitations for mining claims for the State and Territory where the same may be situated, evidence of such possession and working of the claim for such period, shall be sufficient to establish a right to a patent thereunder this Act, in the absence of any adverse claim; Provided, however, That nothing in this act shall be deemed to impair any lien which may have attached in any way whatever to any mining claim or property thereto attached prior to the issuance of a patent.

SEC. 14. And be it further enacted, That all ex parte affidavits required to be made under this Act, or the Act of which it is amendatory, may be verified before an officer authorized to administer oaths within the land districts where the claims may be situated.

SEC. 15. And be it further enacted, That registers and receivers shall receive the same fees for services under this Act as are provided by law for like services under other acts of Congress; and that effect shall be given to the foregoing Act according to such regulations as may be prescribed by the Commissioner of the General Land Office.

SEC. 16. And be it further enacted, That

so much of the Act of March third, eighteen hundred and fifty-three, entitled, "An Act to provide for the survey of the public lands in California, the granting of pre-emption rights, and for other purposes," as provides that none other than township lines shall be surveyed where the lands are mineral, is hereby repealed. And the public surveys are hereby extended over all such lands: Provided, That all subdividing of surveyed lands into lots less than one hundred and sixty acres may be done by county and local surveyors at the expense of the claimants. And provided further, That nothing herein contained shall require the survey of waste or useless lands.

SEC. 17. And be it further enacted, That none of the rights conferred by sections five, eight and nine of the Act to which this Act is amendatory, shall be abrogated by this Act, and the same is hereby extended to all public lands affected by this Act; and all patents granted on pre-emption of homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the ninth section of the Act of which this Act is amendatory; but nothing in this Act shall be construed to repeat, impair, or in any way affect the provisions of the "Act granting to A. Sato the right of way and other privileges to aid in the construction of a drainage and exploring tunnel to the Comstock ledge in the State of Nevada," approved July 25th, 1866.

REDUCTION WORKS AT CHICAGO.—It is proposed to organize a company to build reduction works at Chicago for the smelting of ores from Chicago's "adjacent territories." At least a writer in *The Arts*, a young monthly published in that city, tries to show that the erection of such works is "eminently essential," and that "immense profits and emoluments (are) to be derived by the projection upon a small outlay of capital." We read the article in question in strange perplexity at the sonorous assemblage of meaningless words, and the jumble of places and ideas. When we turned the page, however, and saw the name of Julius Silversmith attached to the tail of the article, we understood the matter fully. Chicago's worst enemy cannot but rejoice at its latest accession, and hope that Julius may raise his company. J. S. has been exploding himself all the way from San Francisco to New York, and is now on the hack track to Chicago. He appears to be a second edition of the "Wandering Jew."

AN IMPORTANT STEP.—By telegraph from Marysville to the San Francisco papers this week, we learn that eight mining claims, north of the Smartsville Consolidated Hydraulic claim, have consolidated, and one hundred and twenty, south of these, are taking steps with the same object. Such a consolidation will be attended, without doubt, with the same beneficial results. For a long time it has been proposed to run a drainage tunnel to the Yuba river, but no one company could undertake the job. This will now be possible, and many other good results will follow. The same account tells us that the Smartsville Consolidated cleaned up \$80,000 from a 60-days' run. There are riches inestimable yet to be gathered from this section.

TIMBER RESOURCES OF PUGET SOUND.—The *Overland Monthly* for July gives some interesting statistics on this point. It seems that, in 1869, 130 million feet of long lumber, 28 million latbs, 3½ million shingles, 2,000 spars and 275,000 feet of piles, were exported from that region, the aggregate value being \$2,067,000. This trade is in its infancy as yet; but when the Northern Pacific Railroad is finished, then it will become a mighty business, and the forests will melt away like the mist.

On the Central Pacific Railroad, during the first four months of this year, 5,043 passengers were carried East and 9,052 were brought West. This shows a gain for the coast of 4,000, or 1,000 per month.

PROF. HITCHCOCK ON THE CALAVERAS SKULL.—Prof. H. writes to the N. Y. *Mineral Journal*, that although there is no doubt of the genuineness of the specimen, and no doubt that it is associated with pliocene fossils and must be very old, still that "the California pliocene is not necessarily older than the drift or glacier deposits of the East and of Northern Europe. There was no drift-period in California—as, for some reason, the glaciers did not extend much west of the Missouri river. Hence, the flora and fauna of the pliocene continued to live on beyond the drift-period into the alluvial. An example is afforded by the big trees which grew east of the Rocky Mountains, in the miocene and pliocene. In the East they became exterminated on account of the glacial cold; in California, the animals and plants continued to live on—some of them to the present day. Hence, it is no criterion of antiquity greater than that of the glacial period, to say that a human skull came from the California pliocene. It may not be 6,000 years old. The Table mountain beds are all of older date."

ANALYSIS OF ALKALINE DEPOSITS.—Samples of alkaline soil of the Great Desert along the line of the Central Pacific, says the *Sacramento Record*, were collected by M. Zacharias and sent to Prof. S. MacAdam, of Edinburgh, who gave the following as the results of his analysis: Soluble in water—principally chloride of sodium (common salt), sulphate of soda, with traces of potash and magnesium salts—67.81. Soluble in acid—principally carbonate of magnesia, with phosphates and oxide of iron—14.23. Insoluble matter—sand and clay—17.95.

FINE BARLEY.—Mr. Managh, ten miles above Yuba City, has a field of 250 acres of barley, which he is confident will yield at least 100 bushels to the acre.

Best Illustrated Newspaper
—FOR—
PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to

**Mining, Farming, Mechanic Arts
AND INDUSTRIAL PROGRESS.**

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the Press and illustrated Patent circulars sent free on receipt of postage stamp.

Agents! Read This!
We will pay Agents a salary of \$30 per week and ex-
penses, or allow a commission, to sell our new and
wonderful inventions. Address M. WAGNER & CO.,
Marshall, Mich. 21v20-2m

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

The Celebrated Studebaker Wagon,

Manufactured by STUDEBAKER BROS. MANUFACTURING CO., South Bend, Indiana. WAGON DEALERS, there are nine reasons why you should buy the above Wagon:
 First.—They are made of the best selected INDIANA TIMBER, thoroughly seasoned under cover.
 Second.—They are made by experienced mechanics.
 Third.—The lightest running and most durable Wagon in the market.
 Fourth.—Their Thimble Skins never break, while all others do.
 Fifth.—Most uniform and best proportioned Wagon in the market; any part of one will fit another, while others make will not.
 Sixth.—The only Wagon in which the SHARP SHOULDER BROS. is used; hence they have the best Wheel, which is actually the foundation of the Wagon, and should be carefully examined by persons buying.
 Seventh.—They are sold only by responsible parties, and every Wagon is warranted to give entire satisfaction.
 Eighth.—Because Transmitters will tell you they are the best Wagon, for all purposes, on the road.
 Ninth.—Last, but not least, Studebaker Brothers are practical men, attend to their business personally, and do not entrust it entirely to foremen, as is generally the case in large factories; hence the superiority of their work over all others. Sold by

COPLAND & DEFRES.
 K street, bet. Seventh and Eighth.

WIESTER & CO.

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.
 A new and valuable GRAIN LIFTER, for raising fallen down Grain that it may be secured by the Header knives. County Rights for sale. Send for particulars.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for Drying, and can be folded as compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

A NEW CORK EXTRACTOR.

This is a simple device of practical utility. It is adapted for Hotels, Saloons and family use. The tightest cork can be drawn with a mere nominal outlay of strength, and without any risk of bruising or hurting the hands. They will be furnished, plain or silver-plated, at manufacturing cost, to parties purchasing Rights. Any person of energy can soon realize the cost of a State Right by selling the Cork Extractors, as they sell readily and afford a large profit. Send for circular.

P. DAVIS' WIRE AND PICKET FENCE.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence, sent on application.

RYAN'S NEW METHOD OF MAKING WHEELS.

To make indestructible iron wheels with little labor and at small cost, is the object of this invention. The hub and spokes are all made out of a single piece of iron. It is first forged down at the ends to the thickness required for the spokes, leaving a hub in the center. The ends are then split into four or more strips each, as shown in the cut above. A represents the hub; B, C, D, E, when spread to their proper position, form the spokes to one-half the wheel. When the other half is split and spread in a similar manner, the spokes are then rounded and shoulders formed on them ready to receive the tire or rim. It is claimed that the great amount of labor and expense heretofore required in making wrought-iron wheels is obviated by this novel mode of construction. There probably never has been a wheel made that is so durable as the Ryan Wheel, and yet the method of construction is so simple that it can be made by any ordinary mechanic in a common blacksmith shop. All territory west of the Rocky Mountains for sale in States or counties. Thomas Ryan, of Scott's Bar, California, is the inventor. Sample wheels, and the iron from which they are made, can be seen at our office, 314 Bush street, San Francisco.

A PAYING BUSINESS—FOR SALE.—The entire interest in a valuable Patent for the Pacific Coast; with Horses, Wagons, Goods, Machinery, etc. A business that any one can engage in, and although new, is already paying large profits.

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted\$2,500
 Second—For the second best design and plan..... 2,000
 Third—For the third best design and plan..... 1,500
 Fourth—For the fourth best design and plan..... 1,000
 Fifth—For the fifth best design and plan..... 600
 The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

Reading for the Hour.

A Market-Place Fifteen Hundred Years Ago.

In the market-place at Athens surged an eager crowd. Fishermen in red caps and short tunics, held up from their movable tanks squirming fish, announcing, with loud cries, that it was now full moon and their wares were at the best. Peddlers darted about with samples of their goods; young girls, offering flowers, wreaths and fillets, wandered between the long lines of wagons, which, while the mules were feeding behind, captivated the eye with lemons, peaches, figs and vegetables. From other wagons the contents of pressed wine-sacks spouted into receiving vessels. Around the colossal statue of the Market-Hermes, meat and sausage hawkers cried their wares, arranged in pillars and festoons, to numerous customers. Among these the rich slaves were the most vociferous—for here, if anywhere, the weight of the purse decided that of the man. While the slave, his purchases finished, turned homeward with a full basket on his head, the poor citizen stole away with his scanty bit under his mantle, lucky if a hole therein did not disclose a full-blooded Athenian's humiliation. Farther on, workers in stucco, and glaze merchants stood between rows of their merchandise, often finished in the most artistic manner. Still farther away, around the triumphal arch raised to commemorate the defeat of Cassander's horsemen, were glittering booths where costly cloths from Asia and the Isles, incense and ointment from India and Arabia, jeweled ornaments and articles to suit every extravagant taste, attracted well-dressed purchasers of either sex.

Without any errand other than to swell the throng and appease their curiosity, young fops elbowed their way through the chaffering groups, now nodding at some fair maid, now criticising the slave-girls exposed for sale, who offered freely to the view every form of female beauty from the blushing Syrian to the dark Ethiopian. Here among a hundred other foreign merchants in the variegated mass might be seen the lively, slender Alexandrian; the coarse-limbed Illyrian in his humble woollen mantle with its red border; men from the boundaries of Persia, easily recognized by their shaggy cone-shaped caps, flowered coats and roomy trousers tied above the ankle; the proud Spaniard with bright mantle of woven bombast; the long-bearded Jew in a dark caftan lined with skins; the luxurious half-Hellen from Asia with perfumed locks, gold rings in his ears, and tunic sweeping to his feet.

Now the hell of the market-policeman sounded through the din, and in a few moments all the booths were taken down, all the wagons harnessed, and the many-colored multitude swallowed up in the mouths of Piræan street, Ceramicus, and the other avenues leading on either side from the Acropolis. Immediately afterward, the arms of a number of city slaves were in motion, polishing the stone pavement of the market, while water-carts crossed and recrossed, pouring forth a fine dewy rain, soon drunk up by breezes from the sea.—*The Last Athenian.*

NEWSPAPERS.—The following statistics are credited to an advertising agent: 5,319 newspapers, and of these 550 are dailies, are published in the U. S. and British America. New York has 32 dailies and over 100 papers in all. Philadelphia has 200. Boston stands third in the list. The largest paper is the *Independent*; the largest daily, the *N. Y. Journal of Commerce*. G. W. Curtiss is the best paid editor, and Theodore Tilton the next. Over \$76,000,000 are invested in newspaper property.

A STRANGE WOMAN.—There comes a story from New York, of a woman who, twenty-one years ago in a fit of anger, declared she would never again speak to her husband. She has kept her word. The pair live together peacefully as man and wife. The husband is kind and attentive and converses with his wife by talking at her to one of his children. The man who believes this story can treat the crowd.

WHAT IS IT?—A telegram from Los Angeles says that that place has adopted a street-grading system similar to that of San Francisco. Poor, stupid Los Angeles!

Abnormal Potato Growth.

EDITORS SCIENTIFIC PRESS:—The article which appeared in the last number of the *SCIENTIFIC PRESS* under the caption of "Singular Freak of a Potato" recalled to my memory a circumstance of a similar character which I experienced in Liverpool, about a quarter of a century ago (the year succeeding the memorable potato famine in Ireland). Owing to the calamity just named, fears existed that a deficiency of tubers for seeding purposes would occur. This fact, combined with an opinion which prevailed, that seed from fresh untainted lands would be preferable, a considerable quantity of tubers were imported from the north of Spain, and, after arrival, were deposited in a close, rather damp, dark cellar. A portion of the importation was sold for seed, but the home supply being found more abundant than anticipated as the seeding season progressed, the demand for the foreign "spuds" slackened, and, as far as my recollection serves me, I was informed that for the last six weeks of that period no purchasers appeared, nor had the cellar been opened during the interval noticed.

When the cellar was rented (about the latter end of May) the potato heap, comprising about two tons, presented a singular and, to the vegetable physiologist, an interesting spectacle. Some of the tubers, perhaps to the amount of one-fourth, were in the condition of damp rotten potatoes; but by far the larger part exhibited appearances analogous to that given in the engraving accompanying the article, and the center heap was found at a very high temperature—ranging from 100° Fah. in the exterior to about 120° in the interior. The interior of these abnormal growing potatoes were also shrivelled, as in the New York instance. I drew the attention of the Royal Agricultural Society of England to the phenomena by sending a box of specimens. At an interview with W. H. Stevens, author of the "Book of the Farm," that gentleman informed me that he had observed similar instances on two or three occasions; it would therefore appear to be an occurrence though rare, still one that has several precedents.

The subject, however, is one that rather merits inquiry and discussion, and if no other of your readers chose to notice the subject, I will, if I can find spare time, perhaps offer a few suggestions as to the exciting cause of this singular mode of development. **THOMAS ROWLANDSON.**

NEW YORK JOURNALISTIC SUCCESSES.—James Gordon Bennett, who began the *Herald* with \$200 or \$300 borrowed money, in an Ann street cellar, writing on a board, is now worth \$5,000,000.

Manton Marble, who, ten years ago, was a task writer on the *Evening Post* at \$25 a week, is at present sole owner of the *World*, valued at least at \$500,000, and has an income of \$75,000 a year.

Henry J. Raymond, at the time of his death, was worth \$300,000, and made every cent of it out of the *Times*.

Horace Greeley, with all his carelessness of, and indifference to money, could be sold out for \$150,000, though he made his entry in the metropolis a poor printer's boy, with all his fortune in a small bundle of clothes swung on a stick.

James and Erastus Brooks have estates valued at more than \$150,000 each, all made from their earnings as owners of the *Express*.

Robert Bonner, not long since a printer at the case, making with very hard work \$30 a week, boasts of possessing \$200,000 worth of horses, has an annual income from the *Ledger* of nearly \$100,000, and would not sell his popular weekly for \$1,000,000.

Henry C. Bowen, after failing as a merchant, turned his entire attention to the management of the *Independent*, and realizes \$90,000 to \$100,000 a year from it.

MILK AT VIENNA.—A correspondent of the *Bulletin*, writing from Vienna, Austria, comments on the purity of the milk he found there, and says that the government inspectors test the article in the milkman's hands and severely punish any attempt at fraud. Moreover, the cow stables are kept with great care and the animals well tended and fed. This is one of the benefits of a monarchical government. He who prefers the freedom of our country must, we fear, put up with an inferior article of milk.

New Books.

MRS. HILL'S NEW COOK BOOK. A Practical System for Private Families, in Town and Country. With Directions for Carving, etc.; together with many Medical and Miscellaneous Receipts, extremely useful in Families. By Mrs. A. P. Hill. New York: Carleton, Publisher. 1870. 8vo; pp. 426. For sale by Bancroft.

It is a custom in Germany in many of the smaller towns for the young ladies to take practical lessons in cooking at the hotels and like places. Thus in this and other ways cooking is made an important part of the education of the female sex. Such a course, however, would be considered "dreadful" in our beloved country, and the little knowledge which a girl acquires is generally through publications. Hence the number of "cook books," of which the above is one of the latest and best. It contains a very large amount of information, which is made quite minute for the benefit of the young and inexperienced house-keeper. In many books a considerable amount of knowledge on the part of the reader is taken for granted. This error is avoided here. There are also instructions about carving, etc., receipts for all sorts of things, meats, vegetables, cordials, pickles, the dairy, cookery for invalids, medicines, directions for making soap, removing greases, cleaning ware, etc.

THE AGRICULTURAL AND OTHER RESOURCES OF CALIFORNIA. By Titus Fay Cronise. With Twenty-one Illustrations. A. Roman & Co., S. F.

Although much has been said and written concerning our State, California is still a *terra incognita* to the majority of people. We have several books containing information as to our resources, prominent among which is the excellent work by Mr. Cronise; but these are not read by the masses. To disseminate everywhere a knowledge of what we have in this country, in an available form, is the object of the present pamphlet of eighty pages. It is filled with matter of interest both to Californians and others. Especially adapted is it for those who desire to settle as farmers, on our broad lands. Here is told where lands may be found, what their quality is, and how they may be obtained, with some interesting facts as to costs, etc. Moreover, the mechanic and the miner will find much instructive matter, and there are facts of interest to all. The reputation of Mr. Cronise's large work is a guarantee of the reliability of his present pamphlet.

GUILTY OR NOT GUILTY. The True Story of Manhattan Well. New York: Carleton, Publisher. For sale by Bancroft, 721 Market street, S. F.

The avowed object of this book is to "enforce the literal truth of the three words, 'founded upon fact,' which [do not] appear upon the title page." The work is the description of the life of a young girl, whose death in 1799, in New York, created a great sensation. For this murder one Levi Weeks was tried, but acquitted, as there was a break in the chain of the testimony against him. The accused was defended by Alexander Hamilton, Aaron Burr and Edward P. Livingston. The story is well written, and although terminating in a tragedy, is by no means sensational. It pretends to give the true history of the case.

LIFE AT HOME, or the Family and its Members. By Wm. Aikman, D. D. 12mo, pp. 249. S. R. Wells, Publisher. For sale by A. Roman & Co., S. F.

This book is written with the object of calling more attention to the way in which family life more congenial and the family ties less stronger than they are in many cases. It contains many suggestions which are well worth reading and pondering over. The following strikes us as particularly apt with regard to San Francisco life: "The family must have a home, and the hotel or the boarding-house can never give it. To have a home which is not all a name, you must have a door which shall open to yours as to no other hand, a threshold upon which you step as the drawbridge to your castle, a house over which you may go with the unthought consciousness that it is yours alone. Its halls must not be the thoroughfare of a hundred passers, and your rooms your only domain."

THE PACIFIC MEDICAL INSTITUTE, which suspended operations several years ago, has been recently reorganized, and the introductory lecture was delivered on Tuesday evening by Dr. H. Gibbons, at the chapel of the City College.

The Income tax was not abolished, as first reported, but reduced.

WALKING STONES.—The following is credited to the *Seaside Oracle*: They have walking stones in Australia, and as we are informed, they have traveling stones in Nevada. Here is a description: They were almost perfectly round, the majority of them as large as a walnut and of an iron nature. When distributed about upon the floor, table or any other level surface, within two or three feet of each other, they immediately begin traveling toward a common center, and there huddling up in a bunch, like a lot of eggs in a nest. A single stone removed to a distance of three and a half feet, upon being released, at once started off with wonderful and somewhat comical celerity to join its fellows; taken away four or five feet, it remained motionless. They are found in a region that, although comparatively level, is nothing but barren rock. Scattered over this barren region are little basins, from a few feet to a rod in diameter, and it is in the bottom of these that the rolling stones are found. They are from the size of a pea to five or six inches in diameter. The cause of these stones rolling together is doubtless to be found in the material of which they are composed, which appears to be loadstone or magnetic iron ore.

THE FOURTH has been celebrated in the regular time-honored manner. We are happy to learn from the daily papers that no other city in the Union ever had such an exhibition of patriotic enthusiasm as ours. We knew in advance that this would be so, and we don't hesitate to add that throughout the whole State there were bigger processions formed, more powder burned, and more liquor drank than in all of the other States combined!

Our city seems to have been very lucky with regard to injury done by fireworks. From the East come reports of more or less extensive conflagrations, but in this last respect, Gold Hill seems to have outdone all other places, taking its size into consideration. There over forty houses on both sides of Main street were destroyed. The material and machinery of the *People's Tribune* were entirely ruined. If this thing continues up at Washoe, there will be but little left to burn in a short time.

INSECTS AS FOOD.—It is said that the poor in the city of Mexico eat large quantities of certain dark colored cakes which resemble brown bread to some extent. These cakes are made of the small eggs of certain kinds of water-hugs, which are collected by placing reeds and other aquatic plants along the borders of the lake near the city; these being soon coated with eggs about the size of mustard seeds. These eggs are dried in the sun and then pounded up into meal. The hugs themselves are caught for food for birds and poultry.

SELF-TAUGHT.—Many men are said to be self-taught. No man was ever taught in any other way. Do you suppose a man is a huckster, to be hung on the wall of knowledge and pumped full? Man is a creature that learns by the exertion of his own faculties. There are aids to learning, of various kinds; but, no matter how many of these aids a man may be surrounded by, after all, the learning is that which he himself acquires. And whether he be in college, or out of school, every man must educate himself. And in our times and our community every man has the means of doing it.—*Beecher.*

MUSICAL BATTERY.—Some one suggests, as the result of the grand musical festivals with choruses and artillery accompaniments, the getting up of a battery of guns of different sizes and cast from different metals, so as to produce the various notes of the scale. He thinks a tune can be played on this as well as on a chime of bells.

COPE DISTRICT LETTER.—In W. H. M.'s letter from Mountain City, published in our issue of June 25th, the name of the Superintendent of the Argenta S. M. Co. should have been printed T. J. Reilly, instead of Kiely.

TWENTY-FOUR YEARS AGO.—Twenty-four years ago last Thursday, the American flag was first raised on these shores. Sometime we of the Pacific coast will celebrate this day.

STEIGER'S LITERARISCHER MONATSBERICHT.—With the May number this literary periodical, the only one published in the German language in the U. S., commenced its second volume. It contains a list of new German publications, besides many exceedingly interesting literary notes and articles. In the account of the "Growth of the Book and News Trade in the United States," we find a condensed history of the firm of Bancroft & Co. of this city, and throughout its pages we meet with most readable matter. Any one desiring the periodical can obtain it, free and prepaid, by addressing Steiger's Literarischer Monatsbericht, 22 and 24 Frankfort street, New York. The proprietor, we must not forget to add, offers a prize of \$800 for the best historical sketch of the intellectual vigor and progress of the German population in North America, more particularly treating of the influence of the German-American Press on the development of American institutions.

NEW WORK BY KUSTEL.—"Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver." Under this title Dewey & Co., of the Scientific Press, San Francisco, will soon publish an excellent work by Guido Kustel. The reputation of the author renders unnecessary any further recommendation of the work, which, it is said, will be a clear and complete treatise on these subjects, which are of so much interest at the present time. Miners and others will find it of great value. The various methods and furnaces employed in roasting, and chlorination and lixiviation with the different manipulations and apparatus, will be fully described, and amply illustrated, together with remarks on the various advantages and disadvantages of each process, and their special application on this coast.

We would be glad to see fifty copies of this work in the hands of those having charge of and interested in mining operations in Alpine. Kustel is on the right track, as time will show.—*Alpine Miner, Silver Mountain, Cal.*

The above work contains 120 pages, and the price is \$2.50 coin or \$3 currency.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

LAYNES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

MULLER'S Brazilian Spectacles are just the thing for people fond of reading whose eyesight is beginning to fail. His great skill as an optician enables him to suit all conditions of sight. It is Muller who supplies the city with opera glasses. *

GLITTERING TEETH.—Not only does SOZONANT impart the whiteness of the purest porcelain to the teeth, but its polish, too. They glisten after being brushed with it, like the inner surface of an ocean shell, and the effect of this peerless dentifrice is to render the enamel as hard and indestructible as adamant.

SAVE and mend the pieces, use "SPALDING'S GLUE."

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye, Opacities of the cornea, cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 314 Bush street. 26-27-28.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms.

KENTON, Gass & Co. San Francisco, July 10, 1870 27-21-3m

TO FARMERS.—Stevens & Bro's Egg Boxes, holding 30 dozen, supplied free of charge, by John Gray & Co., No. 210 Clay street, San Francisco, to all customers. The eggs are kept cool and free from moisture and mould, and are in no danger of being broken, and require no re-counting. 20-20-3m

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10-18 6m B. F. HOWLAND.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14-20

BOILER FELTS saves twenty-five per cent. of fuel. BERRY & PLACER'S MACHINERY DEPOT, No. 114 California street. 1-21-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

New Mining Notices.

Evening Star No. 1 Silver Mining Company.

Location of Works: White Pine County, State of Nevada.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of June, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the second day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of July, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room 5, No. 302 Montgomery street, San Francisco, California. J. H.

POSTPONEMENT.—This day for deemed stock delinquent on the above assessment is hereby postponed until the first day of August, 1870, and the sale thereof until the second day of August, the fourth day of August, 1870. By order of the Board of Trustees.

W. H. WATSON, Secretary.

Mining Notices--Continued.

Cordillera Gold and Silver Mining Company.

Location of Works: Chihuahua, Mexico.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of June, 1870, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 321 Washington street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of August, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY B. REED, Secretary.

Office, 321 Washington street, San Francisco. July

Office of Eclipse Consolidated Mining Company.

Company, 210 Battery street, San Francisco, June 20th. The Annual Meeting of the stockholders of this Company will be held on Saturday, July 23d, 1870, at twelve o'clock, M., for the election of Trustees for the ensuing year and the transaction of any other business that may be presented.

Office, 210 Battery street, San Francisco. July 25-4w

Jennie A. Consolidated Mining Company.

White Pine District, Nevada.

NO ENJOYMENT WITHOUT HEALTH.—Of all the property we own in the world, that which demands the greatest care is our own bodies. Better lose houses, lands, balances in the bank, anything that represents wealth, than the strength, vigor and elasticity of the physical frame. The dyspeptic, the bilious sufferer, the nervous invalid, cannot enjoy the gifts of fortune. Happily, however, dyspepsia, biliousness and nervous debility are removable evils. TARRANT'S EFFERVESCENT SELTZER APERIENT is a specific for them. It renovates the stomach, improves the appetite, cleanses the bowels, regulates the liver, calms the nerves, and disinfects the depraved fluids.

SOLD BY ALL DRUGGISTS.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homopathic Cocoa and Soluble Chocolate, Steam Mills—Brick Lane, London. 5-20-1y

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—New Age.

Greatest Discovery Ever Made.

MR. J. W. MAO, while a resident in New Zealand, was so afflicted with the RHEUMATISM, that for years he was completely crippled and unable to attend to business. The symptoms were of the worst type—knees painful and swollen, with sinews contracted; shoulder, arm and hand rendered useless, and accompanied with continued excruciating pain. While in this state of suffering, he got acquainted with a native of the country, who applied to the parts affected a composition spread on coarse canvas, the properties of which were so wonderful that in a short time all the pain left him, the swelling disappeared, his sinews relieved, and he was able to resume his usual avocations. So effectual has been the remedy, that to this day he has enjoyed perfect health, without the slightest return of his former complaint. Knowing the great blessing such a remedy would be to those afflicted with this painful disease, he with great difficulty and expense obtained the secret of preparing the Plaster; and during the many years MR. MAO has applied these Plasters in New Zealand, Tasmania, New South Wales, and this city, their effect has been marvelous, giving to the most painful and long-standing cases sure and certain relief. The most incredulous will be convinced by referring to these persons: B. W. Owens, 405 Front street; F. B. Alderson, Traveling Agent for Dewey & Co., 414 Clay street; James Flynn, 519 Mission street; Michael Gorman, No. 6 Front street; Mrs. W. S. Wright—late of Gilmore House—513 Folsom street, now agent at Virginia City; E. Shenley, corner Montgomery and Filbert streets; W. M. McLeod, Depository American Tract Society, 557 Market street, and a host of others, who all bear testimony to the unparalleled healing powers of J. W. MAO'S (rightly termed Magic) Plaster, for the cure of Rheumatism, Gout, Weak Loins, Tender Feet and Neuralgia. J. W. MAO may be consulted at his office, rooms Nos. 34, 35 and 36, 128 Kearny street, San Francisco, between the hours of 9 to 12 A. M., 2 to 4 P. M. and 7 to 9 P. M. 18v20-3m

DR. ABORN

Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Anzeria House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 5th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

Dr. Aborn—I take pleasure in bearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.

Oakland, June 3, 1870. WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patients to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burges, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1v21-2m

Free Information for Inventors and Patentees.

Our Patent Office Circular, relating to U. S. and Foreign Patents, Caveats, Patent Laws, Rights of Inventors, Valuable Hints, Illustrated Mechanical Movements, etc., comprises 48 pamphlet pages, embracing the following

List of Contents:

Advancing Cases; Advantages, Important; Assignments, Forms, Cost, etc.; Caveats of what they consist, Form of, Cost, how Filed effectively; Cost of Obtaining Patents; Confidential Advice; Copies of Patents Assignments, etc.; Copyrights; Dangers of Delay; Designs, Patents for; Engravings and Illustrations; Engine, Condensing-Beam—Illustrated; Extension of Patents; Foreign Patents—all Countries; Foreign Inventors; Hints to Inventors; Government Fees, List of; Home Counsel; How to Obtain Patents—Steps Necessary; Hydrostatic Press—Illustrated; Interferences; Influence at Washington; Laws (U. S.) and Decisions Relating to Patents; Lathes, Engine—Illustrated; Letters Patent of what they consist; Library, Reports, Law Books; Locomotive Engine—Illustrated; Medicines or Compounds, Patent for; Mechanical Movements—Illustrated; Mining and Scientific Press Office; Processes, Patents for; Record of Pacific Coast Patents; Re-issues; Rejections—Cause and Remedy; Reports of Patent Office; Rights and Privileges of Inventors and Patentees; Saving of Time; Self-evident Facts; Selling Patent Rights; Springs, Various Kinds—Illustrated; Stamp Battery, Quartz—Illustrated; Telegraph, Patent Business by; Unsuccessful Applicants; Who can Obtain Letters Patents; What Claims can be Patented; Worthless Patents, Candid Reasoning.

This pamphlet will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed by

Advertising and Subscription

Rates for the Scientific Press.

SUBSCRIPTIONS IN ADVANCE.—One year, \$4; six months, \$2.50; single copies, 10 cents; Monthly Series, \$4.50 per annum; Quarterly Series (stiff paper binding) \$5.

ADVERTISING RATES.

We shall adhere to the following rates for advertising in the SCIENTIFIC PRESS from this date:

	1 week.	1 month.	3 months.	1 year.
One sq. (10 lines agate).....	\$1 50	\$3 00	\$8 00	\$32 00
Two squares.....	3 00	5 00	15 00	60 00
Three squares.....	4 50	9 00	20 00	75 00
One-fourth column.....	6 00	12 00	28 00	100 00
Half column.....	12 00	20 00	54 00	200 00
One column.....	20 00	40 00	100 00	400 00

RATES BY THE LINE.
One inch..... 2 00 5 00 10 00 36 00
Two inches..... 3 75 7 00 18 00 70 00
Three inches..... 5 25 12 50 27 00 105 00
Four inches..... 6 75 16 00 36 00 140 00

Per line.—One week, 25 cents; one month, 80 cents; three months, \$2; one year, \$5.

Per line, ten lines or more.—One week, 20 cents; one month, 60 cents; three months, 80 cents; one year, \$3.20.

MINING AND LEGAL ADVERTISEMENTS will be inserted at special rates—less than one-half the cost of daily publication.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form. We will otherwise assist advertisers in getting up their notices, when desired.

All advertisements in the PRESS appear in both the MONTHLY and QUARTERLY SERIES of the SCIENTIFIC PRESS, which (by special arrangement) are placed for FREE READING in the principal hotels, steamboat and steamship saloons, depots, and public reading rooms and libraries in San Francisco and the Pacific States. Many volumes are also bound, thus affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—our advertisers. Better references, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. RICKNELE, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 328 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED

FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

These Machines Stand Unrivalled.

For rapidly pulverizing and amalgamating ore, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Milners are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

Mr. S. H. HERRING, agent for the Scientific Press, has called upon us, and is now in town. He informs us that the Press is rapidly increasing its circulation. We are pleased to hear it, for it is a journal that all should read. Valuable to farmers as well as miners, mechanics and others.—Pajaronian, June 10th.

Oil Cake Meal.

THE BEST FEED KNOWN FOR LIVE STOCK.

We desire to call attention to Oil Cake Meal, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal, and in the United States Government Report of the Department of Agriculture for 1863, it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 per cent.; Barley Meal, 13 per cent.; Oat Meal, 18 per cent.; Oil Cake Meal, 22-24 per cent. For life-sustaining properties to all stock exposed to sudden changes of weather or over-driving, it has no equal.

For MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or with any other feed; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It improves it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

For BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy, and of a much finer quality than when fattened on any other feed, and no feed known will so quickly prepare animals for market as Oil Cake Meal.

For HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness and evenness and glossiness of the hair.

For SHEEP there is no article of food known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price (\$25 per ton) it is the cheapest feed in market. It is now selling in New York at \$42 per ton gold; at \$50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested, has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the manufactory, King street, near Third. All orders will receive prompt attention. Address—

Time Tests the Merits of all things.—For thirty years PERRY DAVIS' PAIN KILLER has been tested in every variety of climate, and by almost every nation known to Americans. It is the almost constant companion and inestimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it.

It is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, and is admirably suited for every race of men on the face of the globe.

Be sure you call for and get the genuine Pain Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine.

23 Directions accompany each bottle. Price 25 cents, 50 cents, and \$1 per bottle. Sold by all medicine dealers. 26v20-1m

RIDER'S

Automatic Cut-off

Vertical Engines

Manufactured by the

Albany St. Iron Works,

NEW YORK.

These Engines are simple, compact and durable, and in point of economy of fuel and space are excelled by none, and are cheaper than any other first-class cut-off Engines in the market. Descriptive pamphlets and price lists mailed free on application to the proprietors, HENDRICK & RIPLEY, Corner Albany and Washington Sts., New York.

25v20-3m16p

RIDER'S GOVERNOR CUT-OFF ENGINE,

Manufactured by the DELAMATER IRON WORKS, WEST THIRTIETH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more care than common engines. Note.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application.

Mann's Patent Earthquake (and Fire) Proof Chimney.

This invention affords a real improvement, which is much needed in this section of country, and as it is just as cheap, can be built more quickly, with less trouble and always perfect, it is very desirable and likely to supersede the old style of chimney.

The chimney is constructed entirely of metal. The lower portion, made of cast, sheet or boiler iron, with a proper opening for a fire-place (which may be built of brick), is of any suitable shape and is intended to rest upon any foundation or upon the floor, if desired, as the whole weight of the chimney will not exceed six or seven hundred pounds. The left-hand figure shows the general appearance of this lower portion. On the right is the chimney-flue, shown in section also, in the middle figure, and below this, is the cover for the lower portion.

The flue is cylindrical and consists of two pipes, one inside of the other, with the annular space between them filled with cement, plaster of paris, asbestos, or other non-conducting material. This flue is secured to the cover, which is fastened to the lower portion of the chimney by rivets or other proper means. The illustration shows the device with one fire-place and one flue. But it can easily be constructed for two fire-places, opening into adjoining rooms on opposite sides of the chimney.

The chimney may be placed directly on the floor, if necessary, and any suitable fire-proof fire-place can be constructed in the recess in the lower portion. Heating drums may be connected with it at any point, and thus the heat is utilized for warming rooms to a very great extent. It is so light that it is quite applicable when a fire-place is needed only in the upper story or stories of a building. The exposed part of the iron can be painted so as to represent brick-work, or ornamented as desired.

Besides this possibility of a cheap and easily-constructed chimney which can be placed in any room, are to be added its fire-proof qualities. As the pipes are made breaking joints, there is no danger of fire should the chimney be racked. This is a point of no small importance.

It cannot be shaken down by an earthquake unless the house comes down with it. It is absolutely fire-proof, as it is impossible by this construction to have such a thing as a defective flue. It does not take up one-half the room of a common chimney.

These chimneys can be constructed of different sizes and styles and kept on hand for sale, so that they can be ordered and set up at once, greatly facilitating rapid building in the country or city.

The inventor offers part of the patent right for sale. He will contract for chimneys on liberal terms.

Address the inventor and patentee,
2v21-1m

BENJAMIN F. MANN, Oakland.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces.

CRUCIBLES, and other fire-standing Goods.

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible Co.—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

J. M. ECKFELDT.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869.—Messrs. A. S. Hallidie & Co., 619 Front street.—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore.

Messrs. A. S. Hallidie & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WOOD & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 23, 1869.—Messrs. A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adams, Gaudier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & Co.,

619 Front street, San Francisco

Luxton's Monitor Peat Machine.

Of the large peaty formation which exists in our State but little exact knowledge is had. The most of it (which is called peat only in the wide significance of the term) seems to be intermixed with sand brought down yearly by the mountain streams, and is not used to any extent. Here and there, in isolated instances, we hear of its being employed for fuel; but its general reputation is not good. We know of but one analysis which has been made—viz: that made by Mr. Knstel of a specimen of New York Island turf and published in the *Press* of June 23d, 1866. The air-dried sample gave, by blow-pipe analysis:

Hygroscopic water.....	13.00
Combustible gas.....	46.70
Carbon.....	21.83
Ash.....	18.30
	99.83

By Berthier's test, samples of this peat reduced from eleven to thirteen times its weight of lead, giving a calorific power of 0.33 to 0.38 (taking that of carbon as 1).

It may be possible, however, that there is more to be obtained from our peat than we now think. At any rate it would do no harm if people in their leisure moments would take pains to investigate the subject. One or two gentlemen have expressed a belief that the article can be utilized in a number of localities at least, but we have no definite information on the point. It seems by no means impossible that it may be used, for the production of gas, either for furnaces, or for illumination, if not in other ways.

Our thoughts have been led in this direction by the accounts of the peat machine which is here illustrated. The object of the device is to take the peat as it comes from the bog, cut it up, and deliver it in a suitable form for drying. The working parts are inclosed in a cylindrical shell, the lower part of which, G, is fastened to the bed-plate, A, while the upper part is hinged at I, so that access to the cutters is always easy. When the machine is in operation, the upper part is shut down and fastened in place by pins or screws through the lugs, T.

The peat is introduced into the shell through a funnel, J, beneath which revolves a spiral wing, P, which forces the peat towards the cutters, K. These are fastened on the shaft, B, and kept a proper distance apart by the collars, L, so that they play in slots in the bed-piece. These slots leave vertical studs or teeth of rectangular form in their cross-section, but tapering edgewise.

In passing through these cutters the peat becomes thoroughly comminuted. It is now received by the spiral spring, R,

and forced out of the machine, through the opening at S, in a sheet or other desirable form. It is affirmed that with 100 revolutions per minute the machine will grind and press 30 tons of peat per hour, and at the usual speed, requiring seven horse-powers, it will work over 150 tons in ten hours, at a cost for attendance of \$75 to \$80.

Were it possible to utilize our peat formations, it would add immensely to the wealth of our State. As a cheap fuel, peat

much less per ton than that usually employed in the manufacture of gas.

There are many other suggestive uses of peat which show the importance of the subject; but we have not space for further remarks. The machine in question is highly spoken of and seems well adapted for its purpose. We have received some specimens of peat which have been treated, and which appear of most excellent quality for fuel. It is the result of years of labor on the part of the inventor, who

LUXTON'S MONITOR PEAT MACHINE.

is consumed in very large quantities. Experiments in running locomotives with this article have turned out so well on the Grand Trunk Railway in Canada that the company has made a contract for one hundred tons daily for one season and three hundred tons daily for the four succeeding seasons. For gas, peat has been used successfully in several places in Europe. In the United States two examples are sent us. Mr. Gilchrist, Superintendent of the Gas Works at Glen's Falls, New York, states that from 125 pounds of dried peat taken from a bog in that town, owned by the Hon. E. H. Rosekrans, he procured 884 cubic feet of illuminating gas, or 5.8-10 feet of gas to the pound of peat, while from the best coal used at the works the yield of gas did not exceed 4.4-10 feet to the pound. At this rate the ton of peat will yield 16,000 feet of gas. Again, at the Glen's Falls Gas Works, Troy, New York, an experiment has been made in substituting peat taken from a bog about three feet below the surface, for coal, and the following were the satisfactory results, viz: One hundred and fifteen feet of dried peat yielded 78 feet of gas, or 5.81 feet per pound, while the best coal yields only 4.41 per pound, the price of the peat being

has been Superintendent of some peat works in New York.

Further information on the subject may be obtained by addressing the patentee, Charles Luxton, Hudson City, N. J., or Wiester & Co., 314 Bush street, S. F.

ZERAH COLBURN.—The statement has been published everywhere that this distinguished engineer died by his own hand. This the *Technologist* is inclined to disbelieve. It mentions the fact that the pistol was found in the left hand of the deceased, who was not left-handed, and that a large sum of money, nearly \$7,000, which Mr. Colburn was known to have had about him, has disappeared. The matter should be investigated, and if a foul murder has been committed, or if strong evidences of such exist, the public should know of it.

EAST RIVER BRIDGE.—The corner stone of the Brooklyn tower, a block of limestone weighing 5,800 pounds, was laid on the 15th of June. The caisson for the New York side is to be somewhat larger than the one now in place.

WEEVIL.—The *Contra Costa Gazette* says that the weevil is damaging some fields of wheat near Clayton.

Government Aid for Mining.

A number of articles have appeared in the *Press*, showing the liberal spirit of the government of Victoria with regard to the mining interests of that colony. With its excellent civil service, that government has been able to construct works which have tended greatly to develop the mineral wealth of the country. One item may be repeated here:—the construction of 43 reservoirs holding seven thousand million of gallons of water (imperial measure) and costing over eleven hundred thousand dollars.

This plan of erecting works, which not only benefit the miner directly, but also bring in a future revenue to the government, is a most excellent one. It is, however, entirely inapplicable in our country, where it would lead to a grand leakage in the public treasury, with a small amount of actual good done. When our civil service is equally good with that of Victoria, than we may begin to think of adopting some such method.

Congress, which will have ended its session by the time our readers see this, seems to have been liberally disposed towards aiding the development of our Western mining interests in the way of granting lands. Quite a number of plans and hills have been brought forward during the session, and a favorable spirit has been displayed. But

there seems to have been considerable confusion, and many bills which have appeared have again been lost to view. One very important measure, with regard to the sale of placer mines, has been pushed on by Mr. Sargent to a successful conclusion. But we have heard of bills in aid of the Sierra Iron Company, of the canal from the mountain lakes of Amador and El Dorado counties to some point in Sacramento county, of the coal and tin interests, and of various other projects, of whose definite condition we are in ignorance.

We have sometimes thought that if we had some special government officer to look after the general interest of the miners, it might be well. We have had a Commissioner of Mining Statistics, whose office, it seems to us, might safely be made a permanency, and raised to a more important position. At any rate, it would be a great gain if, where measures with regard to our mineral resources are proposed, those members of Congress who are not particularly well posted in the matter might have some one to refer to, who would be authority on the subject.

THERE is talk about boring some artesian wells at Sacramento, the residents being dissatisfied with the present water supply.

Communications.

Notes from Idaho Territory.

(CONCLUDED FROM LAST WEEK.)

Poorman Ledge.

This well-known lode, located in 1865, runs nearly north and south and dips at the surface to the west, but shows a depth of 150 feet the dip changes to the east. The ledge matter is very soft, and contains chloride and sulphuret of silver. Very rich sulphuret ores have been found in large bodies or masses, several of these at a depth of from 100 to 200 feet. A large mass holding light red ruby silver ore was taken from this mine and sent to the Paris Exposition, where a gold medal was awarded for it. Often quite large masses of horn silver occur.

In company with the obliging Superintendent, Mr. T. B. Pehsy, I got into the huckst and was let down the shaft. This is 500 feet deep, and almost exactly perpendicular, and there are six levels. The second is the tunnel which runs south from the shaft a distance of 1,300 feet to the side of the mountain. Five hundred feet from the shaft on this tunnel is where the rich deposit was found. Sixteen men are employed in this mine, but soon a larger force will be put at work. Owing to the large amount of water when the snow is melting, it is necessary to abandon the lower level, but operations will be resumed as soon as possible. The shaft is about the best built one I have seen. On the dump are some 300 tons of good milling ore.

Oro Fino Mine.

Near to the preceding, and 2½ miles from Silver City, is the Oro Fino mine, by some considered the best and the largest in the district. There are here many improvements, a good engine and fine hoisting works, and the mine at one time was doing well. But unfortunately no work has been done during this past year on account of litigation. There is a good tunnel; also a fine shaft.

Mr. Robert Bruce has bought the old dump pile, and is at present at work sluicing the fine dirt and picking out the pieces of good ore formerly thrown out with the waste. He showed me some very fine specimens containing fine gold and sulphurets. He will doubtless make a handsome thing by his operation. During the past eight days he has averaged daily a ton of good-paying ore.

Mahogany, Peck & Porter.

The Mahogany mine is located a short distance south of the Chariot. The mining superintendent is Mr. C. H. Young. The shaft is down 165 feet. This company are putting in large wooden boxes and building a small furnace for the purpose of ventilating the mine.

A short distance up the hill is the Peck & Porter mine. The shaft here is down 175 feet. The two companies are to connect their mines, having to sink about ninety feet and then to run an adit. Thus they will be enabled to secure good ventilation. Moreover, an engine will be put up on the upper works, which will be used by both companies for the present.

I see some thirty tons of rock are being crushed by Col. Fogus at the Ida Elmore mill, and as I see in this many specimens holding gold and sulphurets, I am convinced that it will "pan out" well.

Potosi Mine.

The Potosi mine is located near the city. The ledge is small, varying from eight inches to two feet in width, but the ore is good, containing free gold and sulphurets. Some of it which was milled a short time ago yielded all the way from \$30 to \$275 per ton. The ledge runs north and south and the country rock, which on the surface is porphyry, at a depth of seventy-five feet changes into granite. The shaft is some 180 feet deep, and a short distance up the hill is a tunnel, which is now in 180 feet. The mine promises well. Mr. Peck is the Superintendent and owner.

Miners' Foundry.

Silver City has a foundry. It is a small, unpretending affair, but it keeps on steadily and turns out good work. I believe in having such establishments and in patronizing local manufactures, be they on ever so small a scale. This foundry makes

shoes and dies for the mills, turning out some 6,000 pounds of castings weekly, and employing three hands. The old iron is bought up from the mills and worked over. John McMahon & Co. are the owners.

Quartz Mills—Flint District.

There are twelve quartz mills in the county, with an aggregate of about 150 stamps. Only three are in operation at present: the Ida Elmore, 20 stamps; Owyhee, 20 stamps, and Black's mill, in Flint district, 5 stamps. Trask & Son also have a large arrastra running, and are doing good work. I am creditably informed that two more mills will start up in a short time, which will add greatly to the industry of the camp.

Flint district is about nine miles south of Silver City. It has several promising silver-bearing veins, which contain base metals in such abundance as to require roasting before they can be amalgamated. The Rising Star, Astor, Leviathan and Twilight are some of the principal mines. There are three quartz mills in the district.

Other Mines—Agriculture.

The best portion of the placer diggings on Jordan creek and its tributaries have been worked out by the whites and are now occupied chiefly by the Chinese; although there are a few large claims which employ from five to fifteen whites. That branch of mining is not considered of much importance here now, although considerable gold dust finds its way into the market while water lasts in this spring. Frank Shuster & Co. have a very large claim and employ from sixteen to twenty-five men, but have made no clean-up as yet.

Besides the precious minerals, Owyhee boasts of extensive deposits of cinnabar, tin and coal. The coal measures on Reynolds and Sucker creeks, a few miles from town, are represented as of good quality, and quite extensive.

As a grazing country the hills and valleys of Owyhee offer very superior inducements—greater than I had before believed. Ten miles from Silver City, in any direction, cattle require no feed in winter. The nutritious bunch grass and famous white sage keep them fast this year round. This last imparts a peculiar but not disagreeable flavor to the beef. I notice in your valuable paper that several shipments of beef cattle (one of 220 head) have already been made from Idaho to California.

General Remarks.

Of the prospects of Owyhee I have great hopes. In common with all other places on the coast, there are now complaints of dull times. The population, also, of Silver is less than it was in 1866, when there were 3,175 inhabitants here. Still there are now signs of improvement, and merchants and others inform me that business is getting better. Wages are high here, and there is surely a large number of most promising mines already known, with every reason to suppose that there are many more yet undeveloped.

Owyhee has had many adverse circumstances to contend with. Chief among these have been Indian hostilities. The Snake Indians, inhabiting the country lying north and south of the Snake river, have often caused much trouble, and the early prospectors have suffered loss of life and property, as in the case of Mr. Jordan, the discoverer of gold here in 1863, who was killed. But since Gen. Crook took decisive measures to prevent such occurrences, no troubles have been had on this score. Mining, stock-raising and agricultural pursuits, which have been for years neglected, are now being prosecuted with most satisfactory results. I have before given the amount of hullion shipped during 1869. The total product of the mines for that year may safely be estimated at one million dollars, as the sums carried away by private bands would undoubtedly bring it up to that amount. The Central Pacific Railroad has brought the place much nearer San Francisco, and the managers of that road seem to show a most accommodating spirit and to be ready to make any suitable arrangements for the shipment of cattle, freight, etc. Then, as I am told, the firm of E. Reinhardt & Co., forwarding and commission merchants, of Elko, forward from that place to all parts of Idaho at very low rates. They propose to charge less than five cents per pound, dead weight, which is a lower rate than ever before known in this Territory. All these arrangements will do much for the place.

Chicago—Stage Lines.

I understand that several Chicago firms have sent circulars to all the business houses in this Territory soliciting orders and offering good terms. Many find that they can thus get their goods cheaper than they can from San Francisco. Chicago demands the money, however, in thirty days,

and will not give more time. But Chicagoans are enterprising and mean business. Of course people will buy hers of those who will take the most pains to supply them. If San Francisco intends keeping this interior trade she must wake up. She has many advantages over Chicago, but yet she must not sit down quietly and expect people to come and ask her to sell to them when Chicago is constantly on hand bidding against her.

I have previously spoken of Hill Beachy's excellent stage lines from Elko. From this place one takes the Boise and Owyhee stage lines to get to Boise City, sixty miles to the north. The six-horse coaches leave here at 5:30 p. m., and arrive at Boise City at four o'clock next morning. The road is very well kept and the stock is good. A few years ago there was trouble from Indians, but now everything is quiet. At Boise this line connects with Hailey & Pinkham's lines for the north, east and west. The proprietor of this line is Mr. John Early, a most perfect gentleman and a most accommodating stage owner. Kind, attentive and social, he is liked by every one, while at the same time he does well in his business. W. H. M.

Silver City, Idaho, June, 1870.

Smelting at White Pine.

(Written for the Scientific Press.)

EDITORS PRESS:—As it is apparent that your regular correspondent, "W. H. M.," has not exhausted all the sources of information in regard to this district, I take a convenient opportunity to enlighten you and your readers still further on the subject of mining and smelting the base ores thereof.

In the first place I will ask your attention to a few facts contradictory to the assertions of your correspondent, J. Mosheimer. It is notorious that at least seven different furnaces have been in successful operation here for months, and none of them have been in any sense "failures," as Mosheimer would have your readers believe. I will tell you, by and by, in what sense the White Pine Works, started by Mosheim himself, have been and are a "failure."

Successful Smelting.

At the head of all the works in the district stand those of the Alsop Smelting Company, who cleared themselves of all their debts, incurred for construction and repairs, in the first two months' run of the furnaces and made a handsome surplus. This furnace is situated in Shermantown, a mile farther from the Base Range than the White Pine Works. The company has always paid better prices for ore than the White Pine Co., and would continue to do so were it not for the measures taken by the latter to control and depreciate the prices. But more of this anon.

The Alsop Co. has just brought in one of Haskell's water-lined cupolas, for the purpose of reducing copper matt obtained from their large furnaces. The longest run made by this company was 34 days, in the months of April and May. In this run they turned out 157,000 pounds of base bullion. They have since made one run of 72,000 pounds.

The Silver Springs Works, also at Shermantown, come next in order of merit. This company has had difficulties of a personal character to contend with, and the works have passed into different hands on several occasions. But the operations with the furnace have been eminently successful. Upwards of forty tons of hullion were produced by the first company, as much more by the second, and an equal amount by the last proprietor.

Another furnace, called the Shermantown Works, was in successful operation for a time; but want of capital on the part of the owners caused them to suspend for a while.

Wieland's furnace, at Hamilton, has been continuously at work from the commencement, the proprietor paying the best prices for ore, and failing neither in amount of ore nor in profits.

Ratburn's, in the same place, was in operation several months, suspended a short time, and is now about to be started again.

Two furnaces, three miles from Hamilton on the Elko road, built by Raymond & Partridge, made one or two successful runs, when Mr. Partridge went East to obtain capital.

Judge James Walsh has erected the Eagle Works, near Swansea, in conjunction with

Wm. McCourt and S. Gabeldu. Their first run is now being made, with abundant and gratifying success. The works are under the superintendence of Lawrence Hart, a practical assayer and metallurgist. The furnace is a model of compactness, strength and efficiency. The blast is furnished by a ten-horse power engine and a Sturdivant fan three feet in diameter. The tuyeres are supplied with a constant stream of cold water from an elevated tank near the building. The slag is received upon a wrought-iron hearth in front of the furnace, and conducted away in a spout of the same material. High-grade and low-grade ores are scientifically mingled in the charge, and bars of bullion of more than usual richness are the result. This furnace has been running four days, and during that time has produced 186 bars of bullion of 91 pounds each, equal to 8½ tons. Everything about the works is scrupulously neat and tidy, the slag being removed out of the building as fast as drawn. The high-grade ore smelted in this furnace is from the celebrated Trench mine, on the western slopes of White Pine Mountain, below the old Monte Cristo mill. The low-grade ores are from the Mollie Stark, Farewell and others.

Russell Brothers, news-dealers of Hamilton, have a furnace about one mile above the works of the White Pine Co., which has been leased for some time to a company of practical miners and smelters, who have succeeded in realizing for their ore and hullion at least three times as much as has ever been paid for ore by any smelting company in the district. And this, counting in all the lost time for repairs and the drawbacks of want of capital and competition of other works.

Attempts at Monopoly.

The company originated by Mosheimer at the start attempted not only to discourage all other enterprises of the kind, but to fix for all time the prices of ore and the rates of smelting by the ton. The latter the latter was placed so enormously and disproportionately high as to amount to a positive prohibition to the owners of ore from having it worked in that manner. Forty dollars, and even as high as seventy-five, have been charged for smelting ore, for which the White Pine Co. would only offer \$10 and \$20 per ton on the dump. Professor Keyes, Mosheimer's successor as Superintendent of the works, has pursued this same unworthy system of depreciation, even going so far as to endeavor to induce the managers of the Alsop Works to enter into a combination to keep down the prices. His excess is, that this business is unprofitable. Yet the company is now building a still larger furnace to compete with the works of the Alsop Co.

The result of all these monopolizing efforts is, that the miners are leaving the Base Range in large numbers, preferring to take their chances in new districts rather than to mine their ore for seven dollars and a half per ton—all that the White Pine Co. propose to pay for carbonates ore. MINER.

Shermantown, Nev., July 2, 1870.

CAUSTIC LIME FOR INSECTS.—There are few insects that can withstand a dose of freshly-slacked lime. We always keep a quantity of it on hand ready for sprinkling over plants infested with slugs or hogs of any kind, and it has always proved effectual if applied at the right time. Last year, the white-pins worm attacked nearly every pine tree on our place; but two or three dustings of lime when the trees were wet with dew banished or destroyed this pest, which in a few days, if unchecked, would have stripped every leaf from our trees. The asparagus beetle appeared upon our beds of this vegetable in countless numbers, but a few doses of lime have made them leave, and the plants look healthy and vigorous at the present time.

We have driven from our garden the rose-slug, cabbage-flea, and numerous other pests, by the use of this same material, and we have never observed that the plants were damaged by its use. A correspondent at the West says that he has entirely obviated the ravages of the Colorado potato-hug by freely using lime upon the plants, and we have no doubt that others might be equally successful by a persistent use of this material. Lime is so cheap that no one can object to its use on that score, and even if it fails to kill the insects, it will usually do the land good wherever applied. —Hearth and Home.

One barrel of lime to three of fine pulverized, dry earth, is better for most cases than clear lime. The mixed earth and lime should be dusted on liberally, when the leaves are wet with dew, or after a shower or sprinkling.

Mechanical Progress.

Russian Sheet Iron.

Mr. Horbert Barry, an Englishman, late director of the iron works on a certain estate in Russia, has recently published a small book upon the metallurgy of that country. The following description of the method of manufacturing the celebrated Russia iron, as practiced in the Onral district, is quoted by *Engineering* in its review of the book: "The refined iron is hammered under the tilt hammer into narrow slabs, calculated to produce a sheet of finished iron two arches by one (56 in. by 28 in.), weighing when finished from eight to twelve pounds. These slabs are called *baleanky*. They are put into the reheating furnaces, heated to a red heat, and rolled down in three operations to something like a sheet, the rolls being screwed tighter as the surface gets thinner. This must be subsequently hammered to reduce its thickness and receive the *glance*. A number of these sheets having been again heated to a red heat, have charcoal, pounded to as impalpable a powder as possible, shaken between them through the bottom of a linen bag. The pile then receiving a covering and a bottom in the shape of a sheet of thicker iron, is placed under a heavy hammer; the bundle grasped with tongs by two men, is poked backward and forward by the gag, so that every part may be well hammered. So soon as the redness goes off, they are finished so far as this part of the operation goes. So far they have received some of the *glance*, or necessary polish; they are again heated, and treated differently in this respect, that instead of having the powdered charcoal strewn between them, each two red-hot sheets have a cold finished sheet put between them; they are then again hammered and after this process are finished as far as thickness and *glance* goes. Thrown down separately to cool, they are taken to the sheers, placed on a frame of the regulation size, and trimmed. Each sheet is then weighed, and after being thus assorted in weights they are finally sorted into firsts, seconds, and thirds, according to their *glance* and freedom from flaws and spots. A first-class sheet must be like a mirror, without a spot upon it. One hundred pounds of *baleanky* make seventy pounds of finished sheets; but this allowance for waste is far too large and might easily be reduced. Four heats are required to finish."

IMPROVEMENT IN MANUFACTURE OF TWIST DRILLS.—G. Lander, C. E., described the old and the new method before the Liverpool Polytechnic Society in April. The first was by cutting the drill out of a solid round bar by means of milling tools, then turning, tempering and straightening. The other is as follows: "The bar is rolled into a special shape, then cut into lengths and again rolled in cam rolls, which form a straight groove, after which the flank is formed by cresces. Next the blank, as it is now called, is passed to the twisting machine, which consists essentially of a hollow spindle having a perforated nut in the end to receive the blank. This spindle has a motion of rotation on its own axis, and also a motion of translation in the direction of its axis, being thus adapted to twist the blank, held firmly at the outer end by the vise-clamps. Other clamps, worked by suitable gearing, close on the blank as the central spindles clear them; these serve to hold the twist. After twisting, the drills are centered and rough ground, then hardened by heating in a lead bath and cooling in cold water, next tempered in an oil bath, and finished by grinding to a standard gauge. * * By this method of manufacture, the arrangement of the particles of the metal being properly regarded, the number of drills lost from water-cracks in hardening is extremely small."

SOMETHING NEW IN IRON.—The Philadelphia correspondent of the *Iron Age* writes, June 30th: "Experiments are now making in the production of iron in the blast furnace which, if successful on a large scale as in a small way, will make a mighty difference in the production of anthracite pig iron. The improvement consists in the addition to the ores in the furnace of the substance which it is claimed cause the superiority of charcoal iron over anthracite. It is said that anthracite pig iron, equal in every respect to the best Swedish iron, can be produced at no greater cost than for the present article."

Compound Engines Again.

Engineering for June 17th, names the three especial advantages which the double-cylinder engine possesses over the ordinary single cylinder engine.

First: "the cylinder receiving the high pressure steam is never cooled down much below the temperature of that steam, and the low-pressure cylinder, in fact, forms a kind of heat trap between the high-pressure cylinder and the condenser. The second advantage of the compound engine consists in the regularity of motion which can be obtained with it and the facilities it affords for vastly reducing the sudden strain thrown on the moving parts at the commencement of each stroke. The third lies in the fact that with the compound engine the effective differences of steam pressure tending to cause leakage past the pistons and valves are much less than in the single cylinder arrangement, and the difficulty of keeping these parts tight is therefore greatly diminished and the friction reduced."

One reason why the engine of Woolf, early in the present century, did not compete successfully with the Cornish engine, was that the first of these advantages is possessed in a great degree by the Cornish engine also. In other words it follows, from the manner in which the Cornish engine is worked, that but a small proportion of the surface exposed to the fresh steam is ever reduced to the temperature due to the vacuum formed in the cylinder by opening the communication with the condenser. * * "In the Cornish engine the piston and equilibrium valve serve—although less perfectly—much the same purpose as the second cylinder in the compound system, and therefore a competition between the double cylinder and Cornish engines was a very different thing from the competition between compound and single cylinder rotative engines such as is going on at the present day. Moreover, in the competition with the Cornish engine, the second and third advantages mentioned as attending the double cylinder arrangement went almost for nothing."

HYDRAULIC GAS-LIGHTER.—Mr. Magnus Ohren, Vice-President of the British Association of Gas Managers, in his annual address June 7th, thus describes an arrangement devised by a Mr. Hunter: "By one operation the tap is opened, a match struck, and the gas lighted. A service pipe is to be laid throughout the district to be lighted, with branches to each lamp. The pipes are charged with water, and the pressure required is given and maintained from a tank placed at the required elevation. Inside each lamp post is to be placed a small cylinder, to the piston of which is attached a rod. The top of this rod is serrated, and gears into a toothed wheel attached to the plug of the lamp tap which is turned round, and opened as the rod rises. A small fusée drops from a reservoir, and is carried by a swivel plate to a piece of roughened spring, on which it is rubbed and ignited. It is then carried round past the burner, the gas is lighted, and the fusée drops to the bottom of the lantern. In the morning, when the gas is to be extinguished, the pressure of water is taken off the cylinder, and an escape tap opened, the pistons drop with the weight of the rod, and the taps are turned off. It is proposed that as the lamps are cleaned weekly, the lamp cleaner shall supply the reservoir with a week's supply of matches."

ADDIS'S SINGLE-RAIL TRAMWAY.—J. W. Addis, C. E., of Bombay, has devised an arrangement in which two double-flanged bearing wheels, one at each end of the vehicle, run upon a single rail in the center of the road, supporting all, or nearly all, of its weight,—while the ordinary wheels serve to prevent its overturning. Two of the little country bullocks attached to a cart thus rigged drew a load of three one with ease.

OLD RUBBER SHOES UTILIZED.—The *Cabinet Maker* describes a new heel stiffening, made of cast-off over-shoes softened by steam, ground up, dried, spread over a sheet of burlaps, covered with another such sheet, and cut into blanks, which are by power presses forced into moulds under a pressure of 30 tons at a temperature of 220°.

Scientific Progress.

Laws Governing Distillation.

Volatility alone does not determine which of mixed liquids will distill over first. Quantity has something to do with it. If the less volatile be in large excess it tends to come over with the other. But there is still another law. The comparative density of the vapors produced affects the result; the denser vapor having a tendency to be evolved in greater quantity. Dr. Van der Wejde thus closes an article on this subject in *The Technologist*:

"These facts prove that the amount of vapor developed from liquids is regulated by volume and not by weight, or, in other words, that of two liquids possessing the same boiling point, but of which the densities of the vapors differ, the same volumes of vapors will evolve, and that, consequently, the liquid emitting the densest vapor will evaporate in larger quantity; or that if there be two liquids of which the boiling points differ, and that with the lowest boiling point possesses the lightest vapor, the greater volume of the vapor generated from the latter will produce less liquid after recondensation, that the lesser volume of the vapor evolved from the less volatile liquid, the latter thus more than compensating the former, and resulting in the apparent anomaly that, from a mixture of two liquids of different boiling points, the least volatile may sometimes distill over in the largest quantity."

THE WORD PROTOPLASM OBJECTIONABLE. The following paragraph is from the address of the President of the Royal Microscopical Society: "In consequence of the penumbral of diametrically opposite definitions, Dr. Beale rejects the word *protoplasm*, so much in favor with metaphysical physicists, and he enables us to look on at the battle of the giants, vigorously destroying each other's theories but failing to establish their own. In propounding his own views concerning the matter of living beings, Dr. Beale restricts himself to the simple and expressive terms, *germinal matter* and *formed matter*. The former is possessed of *vital properties*, and the latter of *material properties* only. The rather striking difference between dead and living matter seems to justify the rejection of a term which is indiscriminately applied to masses of living things and dead things, and to warrant the use of other terms which are free from the mysteriousness of *protoplasm*, and which properly indicate matter existing in two very different states, *living* and *formed*."

SILICON ALLIED WITH CARBON.—We quote the following from an article by Messrs Friedel and Crafts in *Silliman's Journal*: "The study of the compounds of silicon with alcoholic radicals leads to the discovery of a property of silicon, which allies that element with carbon far more closely than the equality of their atomicity and the similarities hitherto observed in the structure of their compounds. In fact, silicon has been found to possess the property of combining directly with carbon, or rather with hydrocarbons; and the resulting compounds are in every respect similar to simple hydrocarbons, susceptible like them of substitution of chlorine and bromine for hydrogen, and of acting as radicals in alcohols and ethers; consequently silicon may take the place of carbon in a hydrocarbon, and in the series of bodies which can be derived from hydrocarbon, without modifying essentially its properties."

EXCITING LIQUID FOR THE GALVANIC BATTERY.—An article in *Les Mondes*, by M. Delaurier, translated for the *Bowdoin Scientific Review*, has the following: "Having learned that the quantities of sulphuric acid and potassic dichromate, as used, are irrational both in theory and practice, I have made an exciting liquid with convenient quantities. I found it necessary to take 18 parts potassic dichromate, dissolve in 200 parts of water, hot or cold, and then add gradually 42 parts monohydrated sulphuric acid, in all 200 parts. In this manner there is secured a liquid which attacks nearly every metal, particularly iron and zinc, without liberating gas; these metals may serve for the negative pole, and gilded copper or carbon for the positive. This liquid produces a very energetic action, is cheap, and forms a chromic salt of great value."

BRAZILIAN GLACIERS.—Prof. Winchell, of the Michigan University, gives, in the *College Courier*, his reasons for dissecting from the theory of Prof. Agassiz, that continental glaciers invaded Brazil, and moved down the valley of the Amazon during the epoch of the north-temperate glaciation. He says that science is not in possession of satisfactory grounds for assuming that the geological winter was universal and simultaneous. Even the North American glacier appears, from recent observations, not to have covered so wide an extent as was supposed. Among the facts which militate against the theory of Prof. Agassiz, are the absence of glacier scratches; the lack of proof that the "red deposits" are not from rocks disintegrated in place; the presence of leaves in clay which could not have been deposited while the whole country was buried in ice and snow; other evidence of abundant vegetable matter during its deposition; a fossiliferous bed crowded with marine tertiary shells, intercalated between the variegated clays peculiar to the Amazon, described by Prof. Orton; and the occurrence of similar fossils in other localities.

REGENERATION OF THE SPINAL CORD.—Professors Masius and Ven Lair, of Liege, find that an excised segment of the spinal cord of a frog can be reproduced within a short period, and its functions restored. We quote a paragraph by them from the *Microscopical Journal* for May: "A certain number of frogs selected for these researches were operated on below the reflex center of the roots which compose the sciatic plexus in a manner to destroy all spontaneous and reflex mobility in the hind limbs. Another series were operated on above this center so as to preserve the reflex mobility. In both cases, at the end of a month, we have seen the voluntary movements reappear in the previously paralyzed parts, and the conscient sensibility soon after exhibits itself. At the end of six months the frogs move away spontaneously, and perceive impressions just as they did before the operation. The portion of the cord removed was about two millimetres."

NEW FORM OF SPECTROSCOPE.—The *Bowdoin Scientific Review* describes a simple device hit upon in the laboratory at Bowdoin, specially adapted to blow-pipe determinations: "If the lenses be removed from an ordinary spectacle frame, and one of them be replaced by a very small direct-vision spectroscope, we have the instrument in question. The direct-vision spectroscope may consist of the following parts: a compound prism consisting of one flint and two crown-glass prisms, suitably united, and an achromatic lens, all properly mounted in a small tube having an adjustable slit exactly in the focus of the achromatic lens. This instrument may be worn like ordinary spectacles; thus releasing the hands of the operator for necessary manipulations. By this device we are enabled with one eye to study the spectrum while with the other we direct the operations necessary to its production."

LUNAR RADIATION.—The Council of the Royal Astronomical Society, at the last annual meeting, after stating the result of Lord Rosse's observations upon this subject, which have already appeared in the Press, go on to say: "Some later observations have been made upon the same subject in Paris, respectively by M. Baille, at the Ecole Polytechnique, and M. Marié-Davy at the Paris Observatory. The former employed a concave mirror of 39 centimeters aperture to condense the moon's rays upon his pile, and also made use of a Thomson's galvanometer. The one conclusion at which he arrived was, that the full moon, at Paris and in the summer months, gave as much heat to his pile as a radiating surface 6.5 centimeters square, maintained at boiling-water temperature and placed at a distance of 35 meters."

PREPARATION OF CHLORAL HYDRATE.—J. Thomson saturates absolute alcohol with chlorine, heat being applied towards the close of the operation. The liquid is then boiled to drive out the hydrochloric acid; the liquid is distilled on chloride of calcium, the hydrate of chloral passing between 110° and 115° C. One hundred parts alcohol furnish 140 of chloral hydrate. — *Deutsche Chem. Gesellschaft*.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

LEVIATHAN.—*Chronicle*, July 2d: The preliminary smelting was satisfactory. The chimney will be strengthened and the work continued. The mine continues to look well—the body of ore being now over 12 feet in thickness, and assaying from 30 to 50 per cent copper.

ITEMS.—*Miner*, 2d: Last week the Schenectady lower tunnel was pushed ahead 33 feet, and about the same will be made this.... The Globe has made 3 feet a shift for several days past.... The drift in No. 3 tunnel of M. C. is moving on at the rate of over a foot a shift, and must soon reach the east wall.

BUTTE COUNTY.

GOING FORWARD.—*Oroville Record*, July 9th: The iron pipe for the Spring Valley Canal Co. is being forwarded to Cherokee with diligence. The Co. expect to have the canal completed to Concow in time for the winter rains.

CALAVERAS COUNTY.

GOOD ROCK.—*Chronicle*, 9th: B. F. Clerc & Co., the French company, have been crushing good rock from their mine at Upper Rich Gulch. The shaft is sunk 100 feet and is still going down. The rock taken out, so far, averages \$15 per ton.

STRIKE.—Wallace & McIntyre struck a continuation of the old Whisky Slide lead while prospecting, and took \$75 out of a few pans of dirt.

EL DORADO COUNTY.

COON HOLLOW.—The Placerville Democrat of July 9th prints the laws passed at a miners' meeting June 28th. All previous laws are repealed; hill or drift claim shall do three days' work each every three months; ravine or surface claims, three days' work every six months; all claims now held shall be recorded in 60 days; all claims hereafter located shall be recorded in ten days thereafter.

LOS ANGELES COUNTY.

Los Angeles telegram, 11th: The tunnel at the Seapatapal silver mine on the San Gabriel is now in 600 feet. The ledge is reported as struck.

NEVADA COUNTY.

AT EUREKA.—*Grass Valley Union*, July 8th: The Mutual mine has just made a clean-up, after a 22 days' run with five stamps, of \$5,000. The Black & Young is doing well; the Birchfield Co., after running a long tunnel, have struck a strong ledge. The Star mine has a large ledge and good prospects.

LOWELL HILL.—*Gazette*, 6th: Five companies are mining, and ground abandoned as worthless is now giving fair returns by drifting. Three tunnels have been pushed into the Main Divide. The Frick brothers have entered about 900 feet, and found good pay. The gold is coarse, the largest nugget being worth \$87. About 40 men are at work.

COMPLETED.—W. C. Stiles has completed his flume and railroad track, leading from his quartz mill to his mine and hoisting works at the mouth of Roger Williams' ravine.

MOVING.—The machinery of the Salathiel mill is being moved to the Fidelity mine, above Omega. An over-shot water wheel 32 feet in diameter will be used.

ITEMS.—*Transcript*, 6th: The machinery on the Manhattan mine was started up for regular work yesterday.... The owners of the Mulberry ledge, on Gold Flat, have perfected arrangements for the erection of hoisting and pumping machinery.... A difficulty having arisen between the owners of the Orleans and the owners of an extension, the companies have consolidated.... The owners of the Cold Spring claims, three miles above Nevada, on the Washington ridge, purpose erecting machinery to sink for the ancient channel.

BIG CLEAN-UP.—Same of 7th: The Smartsville Consolidated Hydraulic Mining Co. made a clean-up on the 25th of June, of 60 days' run, the result of which is about \$80,000.

WISCONSIN.—Frank Richards has been working this mine on the cooperative plan with his men, retaining in his own hands the control of the work.

SAN JUAN.—Same of 9th: The project of bringing a ditch into San Juan and Sebastopol, by the American Co., has been given up. The matter between the Eureka Lake and the American Mining Co. has been amicably arranged, and on Monday the American will commence washing.

WASHINGTON.—Eshback, Ruth & Co. have been working four years on the har opposite the town. A few weeks ago

they struck into a gravel lead which is paying them \$8 to \$10 a day to the hand. Grissel & Co., below and adjoining, a few days ago struck gravel which prospects remarkably well. They are preparing to commence drifting.

SALE.—Reid, Mills and Rankin have sold one-fourth interest in the Blue Bank claims, Woolsey's Flat, to Wm. Pryde for \$7,500.

GOOD PROSPECTS.—A few weeks ago, Messrs. Pecktal, Worthley and others, located hill claims on the South Yuba side of the ridge, and commenced sinking. They were unable to get to bed-rock on account of the water, when they abandoned the shaft, and commenced another. On Saturday they got to the bed-rock, where they found a rich gravel deposit. We were shown yesterday from two pans of gravel, three dollars. The gold is coarse.

PLUMAS COUNTY.

TAYLORVILLE.—Cor. of Quincy National, July 9th: Most of the mines are doing well, especially the Crescent and the Indian Valley. A prospecting tunnel in the latter a few days ago struck the ledge at the depth of 700 feet. The Celedonia is laid up, and the talk is the ledge is worked out. We prophecy if the mine ever receives a thorough prospecting it will pay well.

PLACER COUNTY.

GOLD RUN.—*Stars and Stripes*, July 7th: During the year 19 hydraulics have been operated while water was plentiful; 10 are still in operation. The Gold Run Co. has made its last clean-up for the year. The Judd Co. cleaned up last week, realizing fifty-eight pounds from their last run, and the Druid Co. made a clean-up from which they realized sixty-eight and one-half pounds. During the season the average yield of the Gold Run hydraulics has been fifteen hundred dollars per day, with every assurance of an equal yield for many years to come. In addition to the hydraulic claims, there are independent enterprises for washing tailings. One of these—Col. Moody's, in Cañon creek—last year yielded between twenty and thirty thousand dollars, and promises to do better this season.

A GRAND PROJECT.—Parties have it in contemplation to cut a tunnel through the Colfax divide, near Secret Town or Long Ravine, from the North Fork or a cañon, sufficiently low to tap Beer river and snice off the tremendous body of tailings that has accumulated there. For miles and miles along that stream the tailings are scores of feet in depth.

The Grass Valley Union, learns from one of the owners of the St Patrick mine, that the shaft has been sunk 115 feet, striking rock richer in gold than any heretofore taken out. Murray & Co. have located the western extension.

SAN BERNARDINO COUNTY.

Los Angeles telegram, July 8th: A shipment of rock has been made to San Francisco from the Coso gold mine in San Bernardino county.

SAN DIEGO COUNTY.

The Union says a second mess meeting of citizens was held on June 18th, to discuss the Cuyamaca grant, and its attempted extension over Julian district. After several speeches, a committee was appointed to ascertain the amount of money which it would be necessary to raise for the purpose of contesting the grant.

SISKIYOU COUNTY.

GOOD CLAIM.—*Yreka Union*, July 8th: The claim of Richardson & Smith continues to pay from thirty-five to sixty ounces per week, for three men's labor. Last week they cleaned up 58 ounces.

ORO FINO.—We have been shown some fine specimens of quartz from a ledge in the mountain west of Oro Fino. The ledge is a foot in thickness and gradually widens as they descend. Trimble & Co. took twenty-three tons and had it crushed at Scott Valley, the rock yielding forty dollars to the ton.

QUARTZ.—Squire Hall is at work on the old Scholes ledge with the most flattering prospects.

Arizona.

WALNUT GROVE.—*Prescott Miner*, June 25th: Messrs. Scott & Henry worked in an arastra two tons of ore from the Rainbow lode, which paid \$192, and six tons from the Neptune, which yielded \$306. Encouraged by this they have commenced running a tunnel in the Rainbow and building an arastra of their own in Peoples' Valley.

WALKER'S.—Some miners working in the Accidental lode say that there is now in the tunnel a large vein of rich ore. Uncle Billy Pointer and C. Y. Shelton were working on their lodes.

TURKEY CREEK.—Jackson McCrackin and

others are prospecting a silver mine in this district.

BIG BUG.—Rogers & Garner were here this week. A general clean-up had not been made, but the outside plates had been cleaned up, and the amount of emulsion therefrom was evidence that the "run" was paying well. Water was getting scarce.

CONQUEST MINE.—LA PAZ.—Cor. of same: Work has recently been resumed. Arastras are in course of construction. The ledge shows free gold in abundance, is visible for 1,200 feet of its length, and has eight shafts sunk on it, besides a number of cuts. There are hundreds of tons of valuable ore already out, with a large amount in sight.

Colorado.

ITEMS.—Central City Herald, July 6th: Chisfee & Co. shipped \$13,500 worth of gold this morning, bought since Monday.... The Gress Valley Co. shipped \$5,000 this week.... Sullivan & Co. this morning brought down a retort of 120 ounces from Roderik Dhu ore crushed in the Lexington mill.

GEORGETOWN.—A body of ore has been found in the Harris mine, which is worth \$300 per ton.... The Baker mine is yielding more ore than the company's wagons can haul away. The Brown is looking better than usual. Huesden is buying ore and paying a higher price. Stewart's new works will be ready to start up in a short time. The Terhile is turning out more first-class ore this month than last. All this ore—worth about \$400 per ton—is shipped to England for reduction. The second-class is treated at Georgetown. The last lot, which yielded about \$200 per ton, was treated by Stewart.

NEVADA DISTRICT.—Richard Kellett is working the Mercer County lode (claim No. 5 west), for the owners. The mine is 380 feet in depth, and has extensive drifts. Vincet & Davey have commenced work on the Central, which they have sunk 30 feet, where they have a rich-looking crevice, though narrow. Richards & Co., working the claim of S. H. Cook, on the Keystone lode have now 14 inches of good-looking iron. Barker, Boulton, Pirce and Lowry are taking out good pay from No. 3 east, on the California. The crevice is wide and the ore gives five to six ounces per ton. Charles Hager is working two claims on the Monitor. Mr. Fleming is sinking two shafts on the Irish Flag, which have reached a depth of 65 and 40 feet respectively. The crevice is two end one-half to three feet in width, and the ore at Whitcomb's mill yields five end one-half to six ounces to the cord.

GRAND ISLAND DISTRICT.—Cor. of same: Outside of Carihou Hill it takes from 15 to 25 feet to strike ore. The greatest activity is on Pomeroy Mountain. Doc. Mann & Co. are sinking down to pay, regardless of time or cost. There are eight log houses up and more started. The Carihou Co. and Mr. Conger commenced to-day to haul ore to Prof. Hill. The Caribou mine will be started up on Monday.

Idaho.

THE SEASON.—Boise City Statesman, July 2d: The mining results have fallen short of expectation. Water has been tolerably plenty in the Basin, but owing to the abundance of snow, a better yield was anticipated than has been realized. Loon creek and the river mines of Middle Boise will no doubt come in to close the season prosperously. The her mining on Snake river will, toward fall, give employment at wages of from five to eight dollars per day for three or four hundred men. In quartz mining there is nothing new. The Owyhee mills are running, and two or three are sustaining their reputation. The general feeling is, however, that the maximum yield has been reached. Altras returns a meagre dividend from her mills.

SALMON RIVER.—The Sonora Democrat of July 9th copies part of a friend's letter from Slete creek: "The season is one month later than usual, owing to late snows. This is all the better, as it gives a longer supply. Most of the boys from Wood's creek depend on hiring out. They receive \$5 per day. It is about an even thing as the cost of living during winter absorbs the summer's earnings. Most all the claims pay well. The gold is fine and light. They are obliged in the claim where I am at work to use about 400 inches of water, and about 200 pounds of quicksilver to seve it. The gold is distributed in the hank in layers 30 or 40 feet in depth. There is no bed-rock.

Montana.

RADERSBURG.—Helena Gazette, July 4th: A nine days' run on the Blacker & Keating mill, 10 stamps, crushing rock from the

Keating lode, produced \$4,573. Keating lode is developed to the depth of 100 feet. The crevice is four end a half feet, end the poorest rock will pay \$30 to the ton.

HIGHLAND.—Rod. Legget brought into town 160 ounces of silver obtained from ore out of the Harvey lode, crushed in an arastra.

ITEMS.—H. Bohm & Co. have just cast a gold brick worth \$20,200 in coin—the largest of the season.... In Nelson Gulch, 10 hands are at work in George Pierce's claim, end doing well.... The ditch subscription has reached \$20,000.

MISSOURI VALLEY.—Cor. of same: Randall & Folsome, after testing Metropolitan har, by ground-slicing, have completed their telegraph for a hydraulic of 80-foot fall, and in a week will be at work with 400 inches of water. On Spokane har, 15 claims are running. The Dancy har ditch will be completed to that place in a few days.

PHILLIPSBURG.—Cor. of same: At the Saunders smelting furnace, the first run made 300 pounds bullion, which will cupel one dollar per pound. The St Louis mill has not yet been leased. The ore in the Merrell & Uley shaft continues good, the upper wall regular and the ledge solid.

RED MOUNTAIN.—Correspondent of the New North-West, July 1st, says water is falling slowly. Cannavan's flume has suspended. Other flumes are all running. The Only Chance Co. have made another good clean-up—60 pounds of amalgam on a 9 days' run.

Nevada.

COPE DISTRICT.

ITEMS.—Elko Independent, 9th: The Argenta Co. has permitted the Crescent to crush 200 tons of ore on the original contract made by the Argenta with the Cope mill.... Vance & Co., owners of the 20-stamp mill now on the way to Cope, have made a contract with the Mountain City Co. to furnish the mill with all the ore that it can crush for 12 months.... Another mill, a 10-stamper, is on the way to Cope from Meadow valley. It will do custom work.... Nash and Johnson, from Bull Run, last week brought good tidings. They had samples which for richness cannot be excelled. Governor Chillis' mine is surpassing expectations. Other late discoveries are represented as wonderful rich.

MOUNTAIN CITY.—Elko Chronicle, July 10th: Al. Cege sent me a fine specimen of ore from the Crescent. Drew's mill is making a run of three or four hundred tons of Crescent ore.

ESMERALDA.

DUNDERBERG.—Carson Appeal, July 7th: This mine, as reported upon by A. H. Griswold, an expert, has a 20-foot ledge, 100 tons ore on dump, which will mill \$50 per ton, a 60-foot shaft, end drifts 96 feet in length, in continuous pay ore.

Some Dunderberg rock which Dr. Munton sent to Virginia for assay, shows \$550 per ton. This was picked up at random from a great mass taken from the main drift.

HUMBOLDT.

BULLION.—Silver State, 8th: During the last week, John C. Fell & Co. shipped from Unionville to San Francisco, 501 pounds of silver bullion.

RAILROAD.—Reveille, 6th: Latest advices from this camp are to the effect that the smelting furnace recently erected is working admirably.

REESE RIVER.

MINERAL HILL.—Cor. of Nevada Gazette, 8th: This is a lively camp with a population of between three and four hundred. There are 50 or 60 mines altogether. The principal ones are the Star of the West, Live Yankee, Great Republic, Giant, Silver Queen, Mary Ann, Vallejo, and the Give Out, all of which, are owned by the Mineral Hill Co. The Austin, Western Slope, and others, are owned by the Austin Co. The average proceeds per ton, of ore worked, some 60 or 80 tons in all, is \$500 per ton, some of it milling as high as \$950.-37. All the rock crushed has been shipped to the Auburn mill at Reno, or the Manhattan mills at Austin. But the mill being built by Curtis & Hunter will be completed by the middle of August. This mill, in every respect, is to be first class, with ten stamps, and a Stetefeldt furnace for roasting. At Cave Hill, two miles north, Coles & Co., Brown & Co., Reese & Co., and others, have locations which promise well. The Gress Valley tunnel Co. are running through the mountain in hope of striking the main ledge.

WASHOE.

SACRAMENTO & MEREDITH.—Enterprise, 10th: The recent clean-up shows a yield of \$8 per ton for the amount crushed.

OPHIR.—Prospecting in the upper works has made no development. The quartz is of a quality as yet below what can be rendered valuable, but is of a good character, indicating good ore near.

OCCIDENTAL.—The winze from the upper works has been extended 380 feet in the direction of the lower tunnel. About 30 tons per day is being extracted and reduced from the upper works. The new mill will be in operation about the 20th. The balance of the machinery has been shipped from San Francisco, and will arrive during the week.

YELLOW JACKET.—The amount of ore extracted has been small. More delay had been caused by the cave than was anticipated.

CHOLLAR-POROSI.—Last week 1,370 tons of ore were extracted—the result of five days' work, showing an average assay of \$64.20 per ton.

VIRGINIA CONSOLIDATED.—About the usual amount of ore from the upper works. This portion of the mine presents a favorable appearance. The tunnel from the lower shaft at the 500-foot level is extended west 417 feet.

SAVAGE.—No change perceptible. A winze being sunk at the lowest level, has not disclosed any encouraging feature.

SIERRA NEVADA.—The ore from the northwest drift is more solid and less associated with debris, it is of greater richness. The quantity of hillion produced is materially increased.

HALE & NORCROSS.—About 75 tons of ore per day extracted. This small yield is owing to the fact that the repairs on the main shaft shunt operations from the lower works. The ore on hand will keep up the supply at the mills.

BELCHER.—The stopes above the 152-foot level are yielding 25 tons daily; average assays, \$22 per ton. A raise is being made south of the shaft, from the 226-foot level. Total hillion receipts for June, \$38,784.

CROWN POINT.—Upper levels still yielding 50 tons of low-grade ore per day. The winze from the 1,000-foot station is down 145 feet.

SIERRA NEVADA.—Mine and mill running as usual, and producing satisfactorily.

WHITE PINE.

REVIEW.—*News*, 11th: The events of the week impart buoyancy to mining operations. The active leading mines have rather increased than diminished the amount of labor employed, and claims that have been for months passive are preparing for a busy season. The new Eberhardt Co. are making extensive preparations to work their mines.

One of the principal stockholders in the Original Hidden Treasure has been here, and we hear whisperings that work will be greatly increased. The rich body of ore struck in the South Aurora, ten days since, turns out to be extensive. The 30 stamps of the Stanford mill are running night and day on South Aurora rock. The Philadelphia Co., who have bought the Glacier, Wabash and Hemlock and other mines, will commence work this morning. Prospecting is persevered in all over Treasure Hill with energy. Some of the standard claims are furnishing custom ore to the mills.

BULLION.—The total amount shipped per Wells, Fargo & Co. last week was \$23,870.88—\$13,845.15 of which went to San Francisco, \$8,470.03 to New York and \$1,554.70 to Carson. The shipment for the week previous aggregated \$23,884.64.

ITEMS.—In the Maggie Consolidated claims, the tunnel is in over 75 feet. Chloridated veins of quartz and gray carbonate ores, carrying silver, have been met continuously from the mouth. The Ticonderoga, a mile to the south and east, is being actively explored. There are now on the dump 100 tons of first-class smelting ore. We have seen a remarkable rich specimen from Jennie A. Consolidated, containing a large quantity of born-silver. Flanagan mine promises well. In the Trench mine new nodules of rich ore have been uncovered. The Micawher mine is turning up something. The Good Hope, in the Base Metal Range, the other day laid open by a shaft the richest ore lately seen. It contained large masses of horn silver.

SMELTING WORKS.—The Walsh furnace, at Swansea, has proved a success, and shipments of bullion are under way. The Alsop has not yet fired up. The White Pine works have been running steadily for forty days. The Eagle is running finely. It has 125 tons of ore on the dump. The Trench mine is the chief source of supply.

OUTSIDE DISTRICTS.—Pinto prospects prime. Shaft in the Maryland down 54 feet in a deposit of high-grade ore, estimated to be 17 feet wide all the way—hot-ton not yet reached. J. J. Dunne has purchased the Champion and Germania

mines, and will put on 25 men. Work commenced on the Galena. In Eureka District Wm. M. Lent, who bought the Buckeye mine, belonging to six Cornishmen, has paid the first installment of \$50,000 in cash.

EUREKA.—Whitney & Co., of Carlin, received, during June, from Eureka, for shipment to New Jersey, 399,423 pounds of hillion. Of this 290,290 pounds were shipped in the interest of Bateman & Bnol.

The Elko Chronicle says 28 tons of ore, estimated to be worth \$700 per ton, were received at that place from the Paige & Corwin mine, Secret Cañon, eight miles from Eureka.

EUREKA.—A correspondent of the *Chico Enterprise* says that Charley Goodwin started a furnace and commenced huying ore to run it; then bought the controlling interest in the Jackson mine for \$7,000, and paid for it in one week's run.

New Mexico.

ITEMS.—*Press and Telegraph*, June 25th: On Willow, are some nine companies at work, taking out from wages to \$7 per day per man. Two men were working on Last Chance with a hydraulic, and we found Conley, Pease & Co. running a new cut on Orleans Flat, and getting ready to use their hydraulic. At the head of Grouse there are few men at work. About a mile down we found a hundred inches of water running in from the big ditch, and four companies opening their claims. Below, Mr. Carpenter has finished his reservoir. The California Co. were ground-slucing with 100 inches water. They are working a out 100 feet wide, with pay dirt averaging 15 feet in thickness. The Chester quartz mill will start up as soon as the wire rope and running stock for the tramway arrive.

UTE CREEK.—There was some excitement in the early part of the week about the reported discovery of new gulch mines. Mr. Morton has been there running a drift into a bank, and on reaching bed-rock commenced panning out, realizing \$35 in three days.

BURRO MINE.—A Los Angeles telegram, July 11th—says: Parties arriving continue to bring glowing accounts of the fabulous wealth of the Burro mines.

Utah.

COTTONWOOD.—A Salt Lake telegram of July 9th says: Mining statistics show that 600 tons of ore have been shipped in less than a year, and mainly from one mine in Cottonwood, netting to the Territory over \$50,000. Five hundred tons are now at Little Cottonwood cañon ready for shipment or melting. Parties will continue to ship until home melting works are completed.

Another from Corinne, 11th: Two hundred tons of ore from the Cottonwood mines were shipped from Salt Lake City during the past week—120 tons to Newark, N. J., and 80 tons to Sacramento.

RIVER MINING.—The Nevada Gazette says that in the gold-mining sections of that county, the beds of many streams, once worked out, are again becoming valuable. Tailings in the river and creek channels pay as often as filled up by gravel and cement from the deep hill diggings. Many of the bars of streams are proving the easiest kind of mining property. In many cases the owners are put to no expense whatever. The hydraulic mines above them fill in their claims gratis every year. The action of water and exposure to the atmosphere pulverizes all the lumps of cement that escape from the first hydraulic process. In many instances these claims are farmed out to Chinamen, the owners receiving from 30 to 50 per cent. of the amount taken out. No longer ago than six years, some 3,000 feet of the bed of Deer creek, below town, was sold for \$300—the owner supposing it would never pay for working again. The same ground is now worth several thousand dollars. As the hill diggings are likely to last for generations, and these river claims must hold out equally as long, some idea may be formed of their value.

The Independent, a new weekly published at Brooklyn, is a good representative of that excellent town. We hear the paper is prospering.

ENCOURAGING REMARKS.—One of our readers writes: "Incorporating an agricultural department into your paper has made it acceptable and really useful all over the country west of the Rocky Mountains, and probably further; and for my part I do not see how an intelligent farmer, minor or mechanic can do without it."

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

PIUTE CO.—Lincoln county, Nev., and San Bernardino county, Cal. June 30. Capital stock, \$5,000,000, in 50,000 shares. Trustees: L. H. Loveland, Wm. H. Sharp, H. C. Greene, Wm. H. V. Cronie and John Moss. **INDEPENDENT GERMAN CONGREGATION.**—S. F. July 1. Trustees: Albert Kaster, Louis Falkenau, Herman Wenzel, Ernest A. Denike, Ludwig Altschul, Carl Hechter, Charles Weher, M. Waterman and Adolph Fried. **ELECTRIC SEWING MACHINE CO.**—June 30. Capital stock, \$600,000, in 600 shares. Trustees: Lewis Cunningham, Leland Stanford, George E. Gray, Thomas B. Shannon, J. C. Birdseye, W. P. Hoffman and R. C. Gaskill.

CONSOLIDATED BURRO.—Grant county, New Mexico. July 5. Capital stock, \$9,000,000; 360,000 shares. Trustees: Robert Morrow, S. Heydenfeldt, G. D. Roberts, J. S. Wall and J. B. Cooper.

PACIFIC BENEVOLENT ASSOCIATION.—July 5. Directors: A. M. Crane, H. J. Brown, N. P. Brown, G. W. Eaine, A. S. Halliday, O. W. Prescott, James M. Patten and W. C. Randolph.

EUREKA CONSOLIDATED M. CO.—Eureka District, Lander county, Nevada. July 6. Capital stock, \$5,000,000, in 50,000 shares. Trustees: F. S. Dodge, W. M. Lent, W. Thompson, W. L. W. Cole and J. C. Bateman. **BUTTER CANAL & M. CO.**—July 6. Capital stock, \$500,000, in 5,000 shares. Trustees: C. L. Bowman, Charles D. Horn, Lewis Schumacher, Hall McAllister and S. Footman.

The following have been recorded in the Secretary of State's office, Sacramento:

DENTON G. & S. Q. M. CO.—Brown's Valley, Yuba county. June 30. Capital stock, \$165,000. Trustees: M. Payton, A. C. Perry and C. More.

THE AUSTRALIAN MAIL SERVICE.

The Bulletin says that there is good authority for stating that Congress will grant the subsidy of \$300,000 asked for by Mr. Webb for his line of steamers, and that the subsidy of \$400,000 will be granted, in all probability, by the colonial government. It states that Mr. Webb's agent has met with many unexpected difficulties. Hall's line, it intimates, was started merely for the purpose of making some advantageous coalition or arrangement with Webb, and not with the idea of making it a permanent enterprise of itself. Mr. Hall has the New Zealand subsidy of \$75,000. "However, we shall soon have a line of ocean steamers established, and permanent colonial travel inaugurated on this route. The line now dragging out a slow existence with the aid of the New Zealand subsidy, will not interfere, and the assistance in question will doubtless be transferred to the new enterprise without much difficulty."

RARE, RICH AND SPICY is the "California Bonzeet," a new and valuable condiment, invented by a resident of this city, and manufactured here. It is an antiscorbutic preparation, and said to be a sure preventative against the diseases incident to sea life. It is also an excellent appetizer, which, if once tried, is seldom abandoned. See advertising column.

THERE are 171 farms in Kern county, each having 20 acres or more under fence, the total number of acres being about 14,015. There are, in addition to the above, some 50 ranchos with less than 20 acres under fence, and about 259 men engaged in agriculture, most of whom have families. —*Exchange.*

California Illustrated.

We have had several pamphlets and hooks on the natural beauties and wonders of our State. We are now to have these depicted on canvas, and brought to us, instead of our going to them. Next Monday evening there will be opened to the public gaze, the pioneer panorama of California.

We haven't seen the work yet, but we take quite an interest in it from the fact that one of those engaged in the project (Mr. Davis) has worked at the case for a long time in our office. Undoubtedly he has become imbued with the spirit of the Press, and desires to aid in disseminating a knowledge of what really exists on this coast. We wish him a hearty success, and give him a good recommendation.

The panorama, projected by California citizens, painted by California artists, and endorsed by California tourists, contains views of the principal points of the Yosemite, the Big Trees, the Geysers, the Mountains, the Lakes and the Cities. After exhibiting in this State, the owners will go East and give the masses a chance to gain a clear idea on some points concerning this land of wonderful stories.

SALT DEPOSITS SOUTH.—The extensive and valuable *salinas* at the head of the bay, in the vicinity of the Rancho La Punta, are, we learn (says the San Diego Union), to be opened and worked in a very short time by a gentleman from the upper part of the State, who has large practical experience in the business. Few of our citizens have an idea of the value of these home salt deposits, which are but ten miles distant from our city. Last year these *salinas* produced over 300 tons of salt; but the gentleman referred to estimates that they are capable of yielding annually ten times that quantity, or 3,000 tons—nearly enough to supply the entire demand of the State. The salt is of excellent quality, being free from alkali—an objection which is made to much of the salt of California. The opening and energetic working of our salt beds, then, is a matter of much importance to San Diego, and it will result in a large and profitable export business. The salt can be easily shipped from the head of the bay in light vessels to steamers or sailing vessels off the town, and at slight cost. Besides, our salt will be exempt to no duty, and will pay no export charges, which amount to nearly \$5 per ton on all obtained from Lower California and Mexico.

THE DARIEN EXPEDITION, which left New York on the 22d of January, returned thither on the 29th of June, and reports that the obstacles to the canal render the work practically impossible. The expedition encountered a series of rivers and high mountains not previously reported, and hostile Indians. All the routes surveyed were impracticable; and after six months of great toil and intense suffering the commander gave up the work and returned to New York. So says one account. Another and later is to the effect that the expedition returned on account of the rainy season, the want of supplies and the lack of funds; and that Captain Selfridge, who had charge of the expedition, will return in November next, Congress willing, and prosecute the work with renewed vigor, and will also make a re-survey of the San Blas route.

A FISHY VISIT.—Week before last a visit was paid to the Salinas river, which the *Castroville Argus* thus describes: "On Wednesday and Thursday last, an immense number of pickerel made their appearance in the bay, near the landings, and swarmy up into the Salinas river for some distance, in pursuit of the small fish called here sardines. The latter sought the shoal water in myriads in their endeavors to escape the vast schools of their voracious pursuers, who, following with gluttonous furv and oharming ignorance of the results of getting into shallow water, soon found themselves too high up on the beach and banks to make any use of their fins. There was no need of hook and line, gig, spear, or net; all that was necessary was to walk down to the water line where they floundered, and gather them up. The residents thereabout and many of our citizens engaged in the sport, and fish have been plenty in town, while wagon-loads of them have been sent back into the country."

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Our Horticultural Visitors.

Our horticultural visitors from the East, Messrs. Wilder & Company, are still engaged in visiting our principal gardens, nurseries and other places of interest. They express themselves in the highest terms of the wonderful and varied productions of our soil and climate. They were much delighted and surprised at the display of orange, lemon, pomegranate, fig, olive and other trees in such full bearing at Dr. Strenzel's and other gardens near Martinez. They are also much surprised at the wonderful yield of cereals which they witness in every portion of their travels. The fields of wheat along the railroad tracks, and at the various shipping points which they have visited, added to the horticultural and vinicultural displays, are giving them an insight into our great and varied agricultural resources, which they had scarcely dreamed of from anything which they had heard or read.

There is nothing like *seeing* to impress and fix belief; especially when the belief asked is so far beyond common acceptance, as is everything connected with the natural productions of California. The visit of these gentlemen, and the kind attentions bestowed upon them by our citizens, will not be lost; as their high standing at the East, and their well known attainments in practical horticultural science, will render the reports which they may carry back a fixed standard by which those who have never visited this coast will judge of our resources. They are getting facts as they travel which they will not fail to use—facts which will tell upon the masses at the East and in Europe, and which will not be without an important influence in directing the steps of thousands who, in coming years, as now, will be leaving the crowded communities of the old world for the more promising, wider and fertile fields of labor in the new.

WHEAT SHIPMENTS.—It is a somewhat noticeable fact in connection with the incoming of the new crop that thus far nearly or quite every hshel of wheat has been loaded at Vallejo, and that of the five or six ships now under charter to load with wheat for England, all are to go to Vallejo. Oakland will also soon come in competition for this business; so that there is a fair chance that San Francisco grain shipments will ere long be confined mainly to the product of San Mateo and the western portion of Santa Clara counties. The present appearances are that not more than one-quarter of the next year's grain crop will find its way to this city. Charges on shipping in this harbor are driving from our wharves one of the heaviest and most important classes of business on the coast. Somebody has blundered.

NEW CABBAGE PEST IN NEVADA.—The Nevada Transcript says that nearly all the cabbage in that vicinity have been destroyed by little insects which the gardeners call cabbage lice. Mr. Leme, of the French gardens, says that this is the first year of these insects. They are about the size of a flea and the color of the cabbage, and their depredations are committed by eating off the stalk at its junction with the head of the cabbage. We are told that the pest is not uncommon in other counties.

RAPID GROWTH.—The Russian River Flag notices, as an instance of the rapidity of California vegetable growth, that Joseph Knowland, of Healdsburg, planted potatoes, peas and beans, on the ninth of April last, and in just two months and six days thereafter supplied his table with new potatoes, green peas and string beans from that planting.

Root Growth.

Whenever the embryo of a plant bursts through its envelop its most obvious peculiarity is, first, to throw a root downwards, and next a stem upward. There are a few exceptions to these rules, however, where both roots and stems manifest an indiscriminate disposition to grow either way, which we have not time now to consider. But where the rule holds, no known power can change this tendency. If the plant be inverted, both the root and stem will at once change their direction of growth. The root seeks the earth, the stem the air.

Depth to which Roots will Grow.

There is also to a great extent a parallelism in the two growths. A luxuriant growth is generally attended with a corresponding development of lateral roots. A tall, rank growth of rye and wheat has been known to form a perfect mat of roots four feet deep in the ground. The roots of winter wheat have been traced to a depth of even seven feet! This extreme length, however, can only be found in very light soil, which is dry near the surface and moist below. Cereals will not go to any such excessive depth unless compelled to do so in search of moisture; and when they do go that deep they generally pass through the dry portion of the soil by roots almost bare of branches, as shown at *b*, between *a* and *d*, in Fig. 1, throwing out from the main root a thick mat of rootlets as soon as moisture is reached. These facts speak volumes in favor of deep culture.

An Interesting Fact in the Root Growth of Cereals.

Some weeks ago we alluded to a special peculiarity of wheat, barley and oats, known as tillering or stooling. There is another and quite interesting peculiarity common to this class of plants, which we will now endeavor to describe by the accompanying illustrations.

After the germ has thrown up its stem, a protuberance will be found as at *d* in Fig. 1. If the seed has been sown deep—say two or three inches, or more—as in the same figure, this protuberance will be found about one inch below the surface, leaving from one to four inches of root, without branchlets, between the seed and this protuberance. If it has been sown very shallow, say one inch deep, as in Fig. 2, the distance between the seed and the protuberance is merely nominal; while if it is barely covered with earth, as in Fig. 3, this connecting link does not appear at all, but the protuberance grows directly out from the germinal end of the seed—the roots, as will be seen, springing out from the protuberance, and not from the seed, as is also the case in the lower sets of roots in both the other figures.

The Significance and Use of this Peculiarity.

Now this peculiarity has a use in agriculture, and its conditions and purposes should be distinctly known to every grower of grain. To premise, we will state that the upper set of roots is known as the cor-

FIG. 1.

FIG. 2.

onal or crown, and the lower as the seminal or seed roots. As has already been stated, at whatever depth the seed may have been sown—two, four or five inches—the coronal roots are always formed at just about such a distance from the surface—about one inch—while the connecting root is generally quite bare of branchlets. It is from this upper or coronal point that the stooling or tillering always takes place. Were it not for this habit or nature of the plant to form that protuberance, the tillering and its important results—described two weeks ago—would not occur. The action or habit here described has been called by some *vegetable instinct*.

Office of these Two Sets of Roots.

The increase and fructification of the plant depends mainly upon the vigorous action of the coronal roots. It is through these roots that the "plant food" is mainly received. The office of the seminal roots is more especially to provide moisture; and in seeking for this, as we have already said, they will sometimes, in loose soils, penetrate to a depth of four and even seven feet. Of course but little plant food can usually be obtained at such a depth. The coronal or food-seeking roots have a tendency to spread out near the surface, where the plant food is usually found, especially on old land which has to be kept in condition by the surface application of manures.

Another Advantage

Derivable from this peculiarity in more northern climates is the fact that these coronal roots are often so badly chilled by late frosts that the plant would be killed were it not for the action of the seminal roots (which are out of the way of the frost) in sending up nourishment for it, until the food-seeking roots have had time to revive and again resume their office. It is for this reason that wheat should be sown deeper in high latitudes than in lower.

An Important Fact for Californians.

There is a very important matter in this connection for Californians to consider in the relation which this habit of the wheat plant has to drouth and deep tillage. It is manifest, by an examination of Figs. 1 and 2, that a plant in the condition of the former is much better calculated to withstand a drouth than one in the condition of the latter. Even if the seminal roots in Fig. 2 could be induced to go as deep for moisture as those in Fig. 1, those in the latter must have a decided advantage, for the reason that the distance from *a* to *d* is made by a single concentrated root or tube, and as such is better fitted to hold and convey the moisture through dry soil, than though it were so carried through a number of smaller roots, as at *c*. In a drouth, the plant in Fig. 2 would derive little or no advantage from its double set of roots, for the lower set would be as much affected as the upper.

The advocates of shallow tillage will derive but little encouragement for their theory when they come to apply thereto the foregoing facts connected with the development and growth of the wheat plant. In our next issue we shall endeavor to give some further facts bearing upon deep tillage and the proper depth of sowing, illustrated with several pointed and highly suggestive engravings.

CASTOR OIL BEANS are much wanted at the oil factory in this city, for which good prices will be paid.

How to Fallow in California.

Last spring I gave the readers of the Press an account of the way that Mr J. V. Webster, of Fruit Vale, cultivated his land for hay. I wish now to repeat the statement, with some additional information, gained from him since my previous letter. On 20 acres of rolling ground that had been run down by constant cropping until it would not produce one ton of poor hay to the acre, he now makes a yield of three tons of fine clear hay, by a system of summer fallowing, conducted as follows:

One-half of his field is fallowed alternately. The half that has yielded the hay this year he is now pasturing till the rainy season commences. Then a volunteer crop of grain, weeds, etc., will spring up thickly. When this growth gets about a foot high—say in February or March—he will plow the green crops under, and again, at the end of the rainy season, he will cross-plow, destroying all the weeds that spring up the second time, and leaving the ground in a light condition. Then, instead of sowing his grain as soon as the rainy season commences, he will let his land lay till January, when another crop of weeds will be growing from the effects of the first rains. These he will again plow under. Then he will sow 175 pounds of grain to the acre and harrow in. After the grain has started the ground will be rolled.

His object of sowing thickly is for hay, and the philosophy thereof is: a thick mat of grain will choke back all weeds, allow a rank growth and still produce fine hay; whereas, if thinly sown, the straws would be too large and coarse. For grain, thin sowing is best.

While Mr. W's land is increasing in richness, and his yield is one-half greater with not over two-thirds the expense, land adjoining his was not considered fit to cut at all this year, it having been run down from constant cropping and overrun with foul weeds.

Blackberries.

Mr. Webster has four acres of blackberries that will rival any plantation in the State for luxuriance of growth, systematic training and size and quality of fruit. He will keep account of their yield, which will be given through the Press.

S. H. HERRING.

New Mode of Fighting Grasshoppers.

At the height of the grasshopper raid in Utah, all the known and available forces for fighting such insects were brought into requisition or suggested. Among the new devices suggested was driving a flock of sheep hurriedly over a field of these insects, which is said to have "depressed" the vermin fully as much or more than any other expedient employed.

Another plan, however, is spoken of by the Salt Lake News as having proved quite effectual. One Brimhall, after carefully watching the habits of these insects, observed that when any considerable number of them were killed, the survivors would leave the foliage and feed upon the bodies of their defunct fellows. Noticing this, he and his assistants armed themselves with willow scourgss, and, passing rapidly over the fields, soon slew enough to draw them off from the crops to feed upon those that had been slain. This having been effected, he had an opportunity to go more leisurely a second time over the fields, to complete his work, while his crops were in the meantime in no wise suffering. By this means, according to the News, he eventually—after twenty-four days of hard fighting—fairly overcame his foes and saved his crops, while others, who pursued different modes, suffered greatly, and in some instances lost almost their entire crops. Their visits are sometimes so early that the scourging process may be carried on in wheat fields, before the grain comes into the joint, when, instead of doing any damage, it is said the crop will be improved by the operation.

ASSESSING SHEEP.—A petition is in circulation in Tulare county requesting the Supervisors to reduce the assessed value of sheep to two dollars per head. The demand is not unreasonable when regard is paid to the rate at which other property is assessed.

Flax Culture Again.

In addition to the 2,500 acres of flax cultivated in Santa Cruz county, noticed last week, I find that there are about 400 acres of flax growing in San Mateo county this season—300 acres at Half Moon Bay, and the balance near Redwood City. Although sown more for the seed than for the straw, it is designed to convert much of the straw into fiber, or to sell it for that purpose. This will surely pay when proper machinery is introduced. But I find that no one has yet any machinery; all seeming disposed to depend upon the Oakland bag factory for a market. It is hardly presumable that the Oakland factory will work up all the crude material which will be produced in this State the present year with their machinery. They are now using jute, which costs them about six cents per pound. This is a long, easily-worked but inferior fiber, imported from the East Indies. What this company consider for their interest in this matter I know not; but while it is to be hoped it will be in favor of flax, it will undoubtedly be with an eye to profits.

Mr. Jacob Weaver, near Redwood City, who has thirty acres, says that he will harvest one thousand pounds of seed to the acre. This, at four cents per pound, will pay him twice the profit of wheat. He will thresh with a common machine and convert his straw into manure.

Flax Growing at Half Moon Bay.

It was my good fortune to fall into company with Mr. W. D. Perine, of Half Moon Bay, the pioneer in flax culture, as a business, on this coast. He came to California from Canada West, where he had been constantly engaged in the culture and manufacture of flax for fifteen years. He was one of the leading men in this business there, and came here with the express design of entering into and developing the business here. This is his third year in California. He has 280 acres of fine flax in cultivation this season. Mr. Perine says that his success exceeds his brightest expectations, and that with proper machinery it will grow into a most important business in this State.

Importance of Good Seed.

He has had difficulty in getting the best sort of seed suited to this climate. From a trial of four different varieties he has selected one that is superior to the rest for oil and for fiber also. By further attention to this particular, in gathering the best to plant every year, he expects to beat the world. The matter of a superior sort is certainly an important one in the cultivation of anything. His straw stands three feet high, while some of the fields I have seen will not reach two feet.

The Need of Machinery.

Mr. Perine says that a good quality of "scutcheel" or cleaned flax is worth 13 cents per pound in the East. He prepared a little by hand last season as a specimen of what this State can produce, and it was on exhibition at the Mechanics' Fair, and elicited high praise. He declares that the one great thing needed here now, to encourage and insure success and permanency in this enterprise here, is machinery. Machinery is needed for harvesting the fields, and for threshing out the seed without injuring the fiber. Flax-brakes and scutching machines must be had also.

Mr. P. showed me some drawings of the most approved machinery used by him in the East. He contemplates sending East for machinery for his own use. He has made applications to mechanics here; but cannot get what he needs without paying twice what it will cost to get the same from the East. He expressed considerable disgust at the prices demanded here.

With a devoted attachment to this enterprise, and an abiding faith in the possible magnitude and importance of the flax business in this State, Mr. Perine is willing and anxious to join hands with the Santa Cruz farmers, and all others interested in this culture, in producing and working the machinery so much needed and so necessary to success and profit. Of the positive value of this industry to California there can no longer remain a doubt, and this matter is well worthy the attention of capitalists as well as of farmers. Its practicability is unquestionable. Its development is a foregone conclusion, but has yet to be

perfected. This matter will be again treated on in the Press, and we hope to be able soon to illustrate and describe some of the latest approved machinery now used in preparing the fiber, etc.

S. H. HERRINO.

Santa Cruz Farmers' Club.

We are indebted to the Secretary, Mr. J. W. Morgan, for the following report of the proceedings of the Santa Cruz Farmers' Club, at their last meeting, held July 21:

Club met pursuant to adjournment, Mr. J. W. Woods in the chair. Minutes of the previous meeting read and approved. The report of committee on the cause of the sudden death of cattle, received. Mr. John Woods stated that in company with Dr. Anderson he made a thorough search for a plant supposed to be poisonous to animals; but could not find any. Mr. Locke thought perhaps the plant referred to was not the cause, but thought that ergot might be. Mr. Humphrey thought there was not sufficient ergot in the grasses hereabouts to produce death. The committee, not being able to make a satisfactory report, were requested to continue their investigations and report at another meeting.

The mode of assessing property in this county was then taken up as the continued subject of discussion. Mr. Feely read from the Santa Cruz Times of some very unequal and injudicious assessments. Mr. Locke thought there was no remedy other than to elect some man to the office of Assessor who would do his duty. Mr. Feely thought that it might be remedied some by the appointment of a committee to examine affairs in that line and appear before the Board of Equalization and show up the facts as they are, taking the assessment roll as their guide. On motion, a committee of three were appointed to examine the assessments and collect all the reliable information concerning them and report at the next meeting of the club. Messrs. Feely, Humphrey and Dakan were appointed such committee.

Subject for discussion at the next meeting: "The Best Mode of Breeding and Managing Stock." Adjourned till Saturday, July 16th.

MORE OF "STEAM CULTURE IN LOUISIANA."—We have made several allusions to the experiments in steam culture, with deep plowing, now in progress on the Magnolia sugar plantation, near New Orleans, and now find the following additional information in the Agricultural Report for May and June, just received, which will be read with interest: "The crop of cane and corn, about 1,000 acres in one field, had been planted on land plowed and cultivated wholly with the steam plow. Not one drop of rain had fallen for more than six weeks, and the crops on the various plantations in the neighborhood, though green, were quite small, from excessive drought. I was surprised when I got to Magnolia to find the cane and corn looking dark and exceedingly thrifty, and I am free to say it is the most splendid-looking crop of cane and corn I saw in the State. The dry weather had not affected the growth of the crops, which were in a forward and flourishing condition. The crop was nearly all laid by, and it had been worked by about half of the usual number of hands. I was shown a few acres of three-year-old ratoon canes that had been deeply sub-soiled with the steam plow, apparently as good as any cane in the field. Mr. L. is very sanguine that the cane crop can be made with steam cultivation, with one-third less mules, one-third less laborers, and will give one-third more yield per acre, than under the old system."

OLD AND YOUNG VINES FOR WINE.—It is claimed that grapes from old vines produce much better wines than grapes from younger vines. Young vines, as a rule, make raw wines which no age will properly soften; while those which have, by age, attained mature and substantial stems make a wine more resembling the old wines of Europe. If this statement is reliable, it affords matter of encouragement for future improvement to those who are cultivating young vineyards. It would also argue in favor of grafting old vines, in changing the variety of grapes, rather than digging up the old to make room for new.

What I Know of Farming—No. 26.

The grass crop of this, as of many, if not most other countries, is undoubtedly the most important of its annual products, requiring by far the largest area of its soil, and furnishing the principal food of its cattle, and thus contributing essentially to the subsistence of its working animals and to the production of those meats which form a large and constantly increasing proportion of the food of every civilized people. But I propose to speak in this essay of that proportion of the grass crop—say 25 to 35 per cent. of the whole—which is cut, cured and housed or stacked for hay, and which is mainly fed out to animals in winter and spring, when frost and snow have divested the earth of herbage or rendered it inaccessible.

The seventh census (1850) returned the hay crop of the preceding year at 13,838,642 tons, which the eighth census increased to 19,129,128 tons, the product of 1859. Confident that most farmers underestimate their hay crops, and that hundreds of thousands who do not consider themselves farmers, but who own or rent little homesteads of two to ten acres each, keeping thereon a cow or two and often a horse, fail to make returns of the two to five tons of hay they annually produce, considering them too trivial, I estimate the actual hay crop of all our States and Territories for the current year at 40,000,000 tons, or about a ton to each inhabitant, although I do not expect the new census to place it much, if any, above 25,000,000 tons. The estimated average value of this crop is \$10 (gold) per ton, making its aggregate value, at my estimate of its quantity, \$400,000,000—and the quantity is constantly and rapidly increasing.

That quantity should be larger from the area devoted to meadows, and the quality a great deal better. I estimate that 30,000,000 acres are annually mowed to obtain these 40,000,000 tons of hay, giving 1½ tons per acre, while the average should certainly not fall below two tons per acre. My upland has a gravelly, rocky soil, not natural to grass, and had been pastured to death for at least a century before I bought it; yet it has yielded me an average of not less than 2½ tons to the acre for the last sixteen years, and will not yield less while I am allowed to farm it. My lowland (hog when I bought it) is henceforth to yield more; but, while imperfectly or not at all drained, it was of course a poor reliance—yielding hounteously in spots, in others little or nothing.

In nothing else is shiftless, slovenly farming so apt to betray itself as in the culture of grass and the management of grass lands. Pastures overgrown with bushes and chequered by quaking, miry bogs; meadows foul with every weed, from while daisy up to the rankest brakes, with hillsides that may once have been productive, but from which crop after crop has been taken and nothing returned to them, until their yield has shrunk to half or three-fourths of a ton of poor hay—these are the average indications of a farm nearly run out by the poorest sort of farming. Such farms were common in the New England of my boyhood; I trust they are less to-day; yet I seldom travel ten miles in any region north or east of the Delaware without seeing one or more of them.

Fifty years ago, I judge that the greater part of the hay made in New England was cut from sour, hoggy land, that was devoted to grass simply because nothing else could be done with it. I have helped to carry the crop off on poles from considerable tracts on which oxen could not venture without miring. It were superfluous to add that no well-bred animal would eat such stuff, unless the choice were between it and absolute starvation. In many cases, a very little work done in opening the rudest surface-drains would have transformed these hogs into decent meadows, and the product, by the help of plowing or seeding, into unexceptionable hay.

There are not many farmers, apart from our wise and skillful dairymen, who use half enough grass-seed; men otherwise thrifty often fail in this respect. If half our ordinary farmers would thoroughly seed down a full third of the area they usually cultivate, and devote to the residue the time and effort they now give to the whole, they would grow more grain and vegetables, while the additional grass would be so much clear gain.

We sow almost exclusively timothy and clover, when there are at least 20 different grasses required by our great diversity of soils, and of which three or four might often be sown together with profit; especially in seeding down fields intended for pasture, we might advantageously use a greater variety and abundance of seed. I

believe that there are grasses not yet adopted and hardly recognized by the great body of our farmers—the buffalo grass of the prairies for one—that will yet be grown and prized over a great part of our country.

As for hay-making, my conviction is strong that our grass is cut in the average from two to three weeks too late, and that not only is our hay greatly damaged thereby, but our meadows needlessly impoverished and exhausted. The formation and perfection of seed always draw heavily upon the soil. A crop of grass cut when the earliest blossoms begin to drop—which, in my judgment, is the only right time—will not impoverish the soil half so much as will the same grass cut three weeks later, while the roots of the earlier cut grass will retain their vitality at least thrice as long as though half the seed had ripened before the crop was harvested. Grass that was fully ripe when cut has lost at least half its nutriment, which no chemistry can ever restore. Hay alone is dry fodder for along winter, especially for young stock; but hay cut after it was dead ripe, is proper nutriment for no animal whatever—not even for old horses, who are popularly supposed to like and thrive upon it.

The fact that our farmers are to generally short-handed throughout the season of the summer harvest, while it seems to explain the error I combat, renders it none the less disastrous and deplorable. I estimate the depreciation in the value of our hay crop, by reason of late cutting, as not less than one-fifth; and, when we consider that a full half of our farmers turn out their cattle to ravage and poach up their fields in quest of fodder a full month earlier than they should, because their hay is nearly or quite exhausted, the consequences of this error are seen to diffuse themselves over the whole economy of the farm.

From the hour in which grass falls under the mower, it ought to be kept in motion until laid at rest in the stack or the barn; keep stirring it with the tedder until it is ready to be raked into light winrows, and turn these over and over until they will answer to go upon the cart. In any bright, hot day, the grass mowed in the morning should be cocked before the dew falls at night; while, if any is mowed after noon, it should be cocked and capped by sunset, even though it be necessary to open it out the next fair morning.

I have a dream of hay-making, especially with regard to clover, without allowing it to be scalded by fierce sunshine. In my dream, the grass is raked and loaded nearly as fast as cut, drawn to the barnyard, and there pitched upon an endless apron, on which it is carried slowly through a drying-house, heated to some 200° Fahrenheit by steam or by charcoal in a furnace below, somewhat after the manner of a hop-kiln. While passing slowly through this heated atmosphere, the grass is continually forked up and shaken so as to expose every lock of it to the drying heat, until it passes off thereby deprived of its moisture and is precipitated into a mow or upon a stack-bottom at the opposite side; load after load being pitched upon the apron continuously, and the drying process going steadily forward by night and by day, and without regard to the weather outside. I do not assert that this vision will ever be realized; but I have known dreams as wild as this transformed by time and thought into beneficent realities.—Horace Greeley.

REMARKABLE EFFECTS OF SUN HEAT—FRUIT COOKED UPON THE TREES, ETC.—We learn from Mr. George G. Briggs that the late very hot days produced quite a serious effect upon the fruit at Putah creek and vicinity. Many of the grapes, two-thirds grown, were fairly cooked upon the vines. Very few bunches escaped the scorching effect of the sun. He says that the White Muscat and Flame Tokay varieties suffered more than the Mission grape. Plums were cooked upon the trees also—a thing never seen before in this State, although it frequently happens that apples and pears are scalded upon one side. The thermometer indicated 114 degrees in the coolest shade.

In 1858 the heat reached 120 in the shade in Marysville, at which time birds were seen to drop dead from the trees and several cases of sunstroke were reported.

DAMAGE FROM CATTLE.—Serious damage is said to have been done to the crops on the San Bonita by large bands of cattle and sheep that are constantly being driven through that region.

Notices to Correspondents.

SERICUM, Columbia, Tnolnmae Co.—There is no work, on this coast, that we are aware of, which answers the purpose of which you speak. The one published by Mr. Prevost, some two or three years since, comes as near to what you desire as any with which we are acquainted. Mr. Bancroft, of this city, has also recently published a small work on the culture of silk and tea, which, we presume, may be obtained at most of the interior bookstands. The best silk manual which we have ever met with, is one published in Boston, Mass., some twenty-five years ago, during the height of the *morus multicaulis* excitement; but this is now out of print.

"CROWQUILL," "E. N. S."—We are obliged to defer these letters to next week.

PERSONAL.—The *Pajaronian* uses rather harsh terms in speaking of a correspondent of ours, S. H. Herring. While we do not profess any responsibility for the ideas of our correspondent's, we deem it but just to say that, to the best of our knowledge and belief, the character of our agent is above suspicion. To defend the reputation of one's city is natural and praiseworthy, but we think that the *Pajaronian* wrongs itself, and is unworthy of its general high ability, when it considers that making insinuations as to the personal character of the gentleman in question is defending the good name of Watsonville.

DEATH OF A JOURNALIST.—Major George W. Wright, late city editor of the *Alta*, died on the 8th inst. in this city. The deceased was one of those who have the happy faculty of making many friends and few enemies, and his character and ability had endeared him to a large circle both in and out of his profession.

A GOLD FEVER is raging in Mayfield in Santa Clara county. Gold has been discovered, it is reported, on Stephen's creek, in the foothills some ten miles from the town. We hear of no heavy strikes, but a nugget worth fifty cents is reported.

STEAMER FOR LAKE TAHOE.—Ben Holladay has bought the little steam propeller yacht Stager, built originally for the Russian Expedition, and sent it up to Lake Tahoe, for the use of excursion parties.

Work at the Foundries.

The foundry business has been better within the past few weeks than for some time previous. In several of the works a larger number of men has been employed than for months before. A walk through all the foundries shows much great activity, and although some do not see much grounds for a permanent improvement, the greater number of foundrymen express the opposite opinion.

The Vulcan Works are busy on an engine for Virginia City, with 16-inch cylinder and 36-inch stroke. They are also making a lot of castings for molds, etc., for various smelting works at White Pine. Among these are some patent slag-trucks for conveying the slag away from the furnaces; these at the same time form slag-bricks, being of the proper shape therefor. They are repairing and adding to a 10-stamp mill which is being moved from Meadow Lake to Cope District, where it will be set up and receive five additional stamps. And they are doing something in the way of store-hoists, besides an indefinite amount of general work.

At the Fulton Foundry, machinery has been ordered for a steamer by the Merchants' and Farmers' Steam Navigation Company of Roseburg, Oregon. This boat will ply on the Umpqua river. There are two engines 14x48, and boilers 56 inches by 16 feet. Here a quartz mill (Vance's Little Giant) has just been completed for Cope District. With this are three amalgamating pans, two settlers and a Brodie crusher. The engine is 10 by 20, and the boiler 48 inches by 16 feet. Another Brodie crusher has just been sent to Nevada, and a third to the Confidence mine, both being of the largest size. A large number of castings have been made for the smelting works of Woodhull & Co., at Salt Lake City, and also for Selby's works. In addition, machinery is being made for a circular sawmill and also for a flour mill, which we to go up the Weiser river in Idaho. The works have been running between sixty and seventy men of late, being kept very busy.

At the Aetna Works, castings are being made for a horse front, for the corner of California and Spring streets, and also for one on Market street. A large engine with 20-inch cylinder and 24-inch stroke is being built for a sawmill for the California and Oregon Railroad Co. The Cope Milling and Mining Co. are having considerable work done here, and there is a lot of furnace castings being made for the San Marcial Company of Mexico. A propeller has been manufactured for the steamer Escort. A dozen sets of car-wheels have been cast for the Seattle Coal Mining Company of Washington Territory. Besides these items, other general work has been received, and the works have been running at their fullest capacity.

The Golden State Works seem to have been very fortunate in securing work since their late fire. They make a specialty of Stevenson's Patent Mold Board and Amalgamating Pan, which was illustrated in the Press of April 2d, and which, they say, is rapidly coming into favor. Besides these they have been making castings of various descriptions for the mills at Virginia City, pumping works and hoisting machinery for Pine Grove, etc., keeping the men (who are working on the coöperative plan) up to their hest.

The Risdon Iron Works are at present very busy. They are engaged on a ten-stamp quartz mill with four amalgamating pans and other apparatus, and also with hoisting works, etc., which are to be sent to Calaveras county. They are building hoisting works for the Eastport Coal Mining Company of Oregon, some work for Mexico, and have a considerable amount of steamboat work on hand. But it is in the boiler department that the greatest activity

is shown. Here the ground and floor are covered with pipes, and the din of the hammering is deafening. Over twelve miles of sheet-iron pipe, thirty inches in diameter, are being made for the Spring Valley Water Works, at the rate of 700 feet per day. Some of the pipe made by the Risdon Works have been in use ten years.

Some three miles of the same pipe, of No. 14 to 3/4 iron, are being made for the Cherokee Mining Company. This pipe is intended for one of the boldest plans yet undertaken in California: conveying water down and up the sides of a ravine whose vertical depth is 850 feet. We do not at present remember any case where the depth has 300 feet. This pipe-making, together with work on five steam boilers of various sizes, give employment to upwards of 300 men.

California Agricultural Notes.

THE wheat crop is being rapidly harvested and taken to market. At nearly all the stations on the line of the Vallejo Railroad, says the *Marysville Appeal*, immense piles of grain are stacked up to be taken to navigation. Trains are kept running night and day loaded with wheat, yet these great piles do not appear to diminish.

The Vallejo *Recorder* says that the crop along the line of the old Napa and Benicia road is unusually good this season, affording forty to fifty bushels to the acre. The farmers in that section are jubilant over the rich results of their labor, and receive this rich earth gift as the legitimate reward of attention and industry in their honorable vocation.

Especial arrangements are being made by the Central Pacific to accommodate the farmers along the line of that road. Temporary side tracks, and, where necessary, special trains will be run. Freight for the Stanislaus river has been fixed at \$2.70 per ton.

STOCK FROM SOUTHERN CALIFORNIA is being driven over the mountains, whenever practicable, in large numbers, to save it from the drouth. Sheep are, for the same reason, being forced into market in larger numbers than usual. It has been decided to reduce a flock of 50,000 on the island of Santa Cruz to 40,000 in order to increase the chances of saving the smaller number. The reduction will be effected by slaughtering 10,000, making the most of their pelts and tallow, and salting down the hind quarters. We may therefore look for an early and extensive supply of pickled mutton in this market.

SUMMER FALLOWING.—The following item from the *Monterey Republican* contains a useful and practical lesson, and one which the farmers generally, throughout the State, ought to profit from: "The vast benefits which issue from summer fallowing have been illustrated this year in many portions of the State, land which has been cultivated in this manner yielding an incomparably greater quantity of grain than the same character of land on which summer fallowing has not been practiced." An interesting article on summer fallowing will be found on another page of the present issue.

FLAX and flax seed is in great demand in this city for the supply of the linseed oil works at the foot of Third street. Both the seed and fiber of flax can be sold here at all times and at remunerative prices. Flax cannot, like wheat, barley, etc., be profitably produced on most soils; but only where the conditions of both soil and climate are favorable. An interesting article on flax culture in this State will be found in another column of our present issue.

EXPERIMENT IN RICE CULTURE.—The *Alta* says that "rice of the California variety" is now growing and standing a foot high on Andras Island, near Giorgia

Slough, in Sacramento county. Mr. Giogorn, who has sown about a bushel of seed at that locality, has had considerable experience in rice cultivation in South Carolina, and thinks it will do well on the fresh tle land of that portion of the Sacramento where it can be properly irrigated.

FROM SAN LEANDRO.—The farmers have commenced harvesting on the Estudillo ranch, where an average of wheat is expected of from thirty to forty sacks per acre. The fruit there has suffered much from the late excessive sun-heat, the large fruit especially, and in some instances even currants have been partially cooked. Much damage has also been done to vegetables by a species of plant lice.

CANARY SEED.—The Provost brothers, of Denver, have about 80 acres of canary seed now growing and looking well. They have also 1,000 acres in wheat and 200 in flax. They believe, to some extent at least, in diversified farming. They might undoubtedly still further improve their practice by adding to their products root crops, cattle and swine.

LATE CROPS.—Some of the farmers in the vicinity of Marysville have but quite recently planted potatoes and crops on their low grounds, which it is thought will do well. The editor of the *Sacramento Bee* says he never saw better potatoes than come from tule lands in that county planted in July, 1864—the dry year.

THE best crops in California, this season, are generally in the counties to the north of this city and Sacramento, where the greatest quantity of rain has fallen. To the southward, wherever the sea fog has prevailed to any considerable extent, the crops have suffered less than where they are usually absent.

CURRENTS are becoming an important article of small-fruit culture about the bay. The currant appears to do remarkably well here, is less perishable than most small fruit, is very useful to put up, and any surplus is readily converted into currant jelly, for which there is a large and growing demand.

CUTTING WHEAT FOR HAY—BAD SPECULATION.—Quite a number of parties in various sections of the State, anticipating a greater damage from the drouth than was actually realized, cut their wheat for hay; while their neighbors, who allowed their grain to mature, are now realizing fair crops.

FATAL CATTLE DISEASE IN THIS CITY. Chas. Imhourg informs the *Alta* that forty-three head of cattle in one herd and thirty-five in another have recently died in this city from a disease, the nature of which we infer is unknown, but which, among other symptoms, shows ulcers under the skin.

THE STATE FAIR.—The annual fair of the Agricultural Society will be held at Sacramento on the 17th of September. The usual facilities of half fare will be extended by the railroads and steamboats to visitors, and all packages intended for exhibition will be transported free.

LOOKING FOR LAND.—Parties from the East are now in Butte county looking for lands on which to settle. We suppose the land along the line of our railroads will first be occupied, and as the population is crowded back into the foot-hills, they will find that "the last shall be first." Experiments with our red soil proves it to be excellent grain-producing land.—*Butte County Record*.

SUIT AGAINST THE NEW ALMADEN CO.—The Commonwealth of Pennsylvania has brought a suit against the New Almaden Quicksilver Mining Company for the sum of \$100,000. The case is set for trial on the first Monday in December.

W. H. M. writes us that we mistook his figures in regard to the cost of the Elko Court House, which were \$25,000.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JULY 5TH.
SUPPLEMENTARY PEDAL ATTACHMENT FOR PIANO-FORTES.—Gustav A. Scott and W. B. Frisbee, San Francisco.
APPARATUS FOR SAVING MERCURY FROM THE WASHINGS OF GOLD AND SILVER ORES.—Wells Spicer, Summit county, Colorado Territory.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The Mexican Pirate.

The crisis of the *Forward* has been glorious but brief. The patriotism of Placido Vega having waned before the hopes of plunder, he sent this vessel to sack the city of Guaymas, which operation was successfully performed. The pretence set up for the act was that Vega was carrying on a revolutionary war, and the flag of the republic of San Salvador was hoisted for the occasion. Having seized a large amount of booty, the pirate retired to a hiding place on the river Teacapan, the U. S. steamer *Mohican* following her and destroying her by fire, as the *Forward* was aground and could not be taken out of the river. In the skirmish with the pirates, who had erected a battery on the bank of the river, one of the *Mohican's* crew was killed, and several wounded, of the latter one, at least, fatally. The act of the United States steamer has created considerable excitement, and it would appear that many of the Mexicans are highly indignant thereat. But this cannot be wondered at. There has always existed a great hatred against the United States on the part of a large class of the Mexicans, and there always will be until that country gets civilized. Our only regret at the action of Commander Low is, that he thereby sacrificed the life of some of his men in behalf of a people who will hardly be grateful for the benefit done them.

THE STEAMBOAT RACE.—The greatest excitement for years in the Mississippi valley has been caused by a race, from New Orleans to Cairo, and thence on to St. Louis, between the R. E. Lee and the Natchez, two rival boats. The Lee started out ahead, followed immediately by the Natchez, and as the steamers panted up the stream, the excitement increased, and the amount of money bet on the result grew exceedingly large. At Cairo the Lee led her antagonist about twenty miles, and came in the victor at St. Louis, the Natchez being detained by a fog. Over a million of dollars, it is said, changed hands in consequence of the race. The event shows that this racing spirit still exists in its pristine vigor. A rather remarkable fact is that notwithstanding all improvements in building boats, this is the first time that a quicker passage has been made than that of the White, which ran against time twenty-six years ago.

ANOTHER EXPLOSION.—On the morning of the 9th inst. an explosion occurred at the California Powder Works, which resulted in the death of one man and the wounding of two. Carelessness was the cause. It appears that the Assistant Superintendent, John Harry, attempted to dry some fulminating powder for filling caps. The requisite amount of care was not taken, as is said, and an explosion occurred, destroying a small building called the "cap-filling room," instantly killing Harry and knocking insensible a couple of Chinamen.

THE SECOND STREET CUT report shows that the assessments for benefits were \$626,773.28; the damages allowed to property, \$278,608.43; the cost of work and expenses of commission, \$348,164.85.

Our Home Industries.

The Facilities for Smelting Ores in San Francisco.

The *White Pine News* recently, in an article on the enlargement of the Newark, (N. J.) Reduction Works, alleges that this was rendered necessary by the increase of shipments of base metal ores, the smelting facilities in this city being so limited in capacity and slow in doing the work and making returns that miners of Utah and Nevada are obliged to send their ores to the Atlantic States for treatment. So far, however, from this being the case, as the *Bulletin* shows in the following article, we have in San Francisco the most extensive smelting works in the United States, which have been quietly growing up during the last four years, in a remote part of the city, and almost unknown beyond the large number of workmen immediately engaged and the mining and freighting interests which are employed in furnishing ores and crude bullion. We refer to the lead and silver smelt-

ing works of Mayor Thos. H. Selby, near Black Point, an establishment of the first importance as a means of developing the mines of the Pacific coast, and with reference to the value of its transactions. These works, which we have recently visited, consume the great majority of all the ore and crude bullion shipped to San Francisco, and they are being constantly increased in extent to keep pace with the expansion of the industrial interests with which they are associated. Their present capacity can be enlarged to an unlimited extent; but even now the quantity of crude bullion and ore consumed exceeds that of any other lead and silver smelting works in the country—probably working up twice the amount used by the Newark Reduction Works, which at one time were considered the largest in the United States.

Superiority of San Francisco as a Depot for Ores.

The legitimate place for smelting ores would seem to be at the mines from which they are extracted; but as they can be more advantageously treated where science, skilled labor and capital are concentrated, as at the seaboard cities, the nearest and most available locality is undoubtedly San Francisco. From the mines of Nevada and Utah to this city the distance is so small, compared with that to the Atlantic States, as to constitute the former the natural customer for their ores, rendering successful competition from the East out of the question. And we propose to show that in our city the facilities for smelting are superior to what are offered in any other locality. The small shipments of ores, which upon the opening of the Pacific Railroad went East as experiments, soon established these facts, as well that higher rates are paid at the smelting works here than can be obtained elsewhere in the United States, while the cost of transportation is at least

a half less in favor of San Francisco, to say nothing of the considerable percentage of ore that is lost by car shifting and the jolting and sifting incident to so long a transit.

Better Prices Paid in San Francisco.

Some of the shippers who for a time gave Newark a trial, soon became satisfied of this, and are now again sending their ores to San Francisco, not only because the work is done cheaper here and the charges are less, but the treatment is more thorough, and consequently the yield greater. This same rule as to cheapness applies to ores that have been shipped to Swansea for reduction, and there is this additional fact in connection with that market, that while miners complain of not receiving fair returns from Swansea, experience has shown them that at Mr. Selby's works they are honorably and promptly paid.

System of Making Returns.

As regards the time consumed in the treatment of ores, miners will find that the advantages, on account of the late improvements, will be largely in favor of San Francisco, and that returns will be made with very little delay. The rule adopted by Mr. Selby is to buy the ores, which is conveniently done, owing to the extent of his connections and agencies throughout the mining region. The works are always ready to pay shipping expenses on ore from anywhere, and meet freight bills promptly on delivery—the bills of all kinds following the metal.

Where the Ore Comes From.

Although a large and increasing amount of ore is received at the works from Nevada and Utah, they are by no means dependent on those States for their supply, which arrives from about every important lead and silver locality on the Pacific coast, including the distant mining regions of New Mexico, Arizona, Mexico, and along the Colorado river, whence they are brought by sea via the Gulf of California. No crude bullion nor ores are refused, unless the latter are of too low a grade to admit of profitable reduction. In the early history of the enterprise, ores for a while came too fast for the extent of the works; but with the present enlarged facilities it would be difficult to overtask their capacity, which can at short notice be increased so as to meet any demand likely to be made upon them in the future. They were originally designed by Mr. Selby, in joint interest with his New York partner, Mr. P. Naylor (now on his first visit to California, during a business association of 20 years), for the purpose of supplying their hot tower in this city with lead. The idea of manufacturing for Eastern markets, or for exportation, had not then been entertained. For a long time the business was not a financial success, and a less persistent man than Mr. Selby would have abandoned the attempt. Costly experiments were necessary, and heavy expenditures attended the enterprise before returns began to be realized. The result is the most important lead and silver establishment in the country, employing, directly and indirectly, more than a thousand men in the various callings with which it is associated. It is the friend of the workmen, for whom it acts as a reliable bank of deposit, and whose labor it converts into ready cash on demand.

Location of the Smelting Works.

The location of the works, which occupy four fifty-acre lots, is on Jefferson street, at the northern extremity of the city, on a point of land projecting into the bay opposite Fort Alcatraz, and at the northern terminus of Montgomery avenue, that is to be. On the bay there is ample wharf frontage, with depth of water sufficient to accommodate the vessels engaged in bringing ores and crude bullion to the works, and carrying away lead and silver. This bulkhead wharf is being steadily pushed out into the bay by the accumulations of slag and other matter—real estate being thus created at a rapid rate. A railroad for hand care extends through the works to the water front, serving the double purpose of conveying market lead to the vessels at the wharf and for dumping the refuse collections at the bulkhead. The works, which are indicated from a considerable distance by a large stack, are approached by a plank road laid through the sand drifts which here reach nearly to the shores of the bay. Formidable notices of "No Admission," posted over the gateway, remind one that the inmates are supposed to know how to keep their own counsel.

Outline of the Process of Reduction.

The entire works are under the general supervision of Prentiss Selby, a son of the proprietor, who, from the beginning, has aided in bringing them to their present

state of efficiency, and who has recently returned from a short visit to examine the smelting facilities in the Atlantic States—a tour of inspection, which, it may be added, showed that the business as conducted in San Francisco is far in advance of any Eastern competition. The immediate Superintendent, R. W. Thompson, who entered upon his duties when the works were yet in an experimental condition, explained to us in detail the various processes. We do not propose to risk violating confidence by an attempt at description. Suffice it to generalize by stating that the ore, landed at the wharf, is brought by railroad into the works, where it is crushed, sampled and prepared for calcining; thence it goes to the blast furnace to be smelted; thence to the refining furnaces, where it is cleared of its base matter; thence to the desilvering furnaces which separate the silver from the lead. Here it "splits" and takes two directions—the lead going to the refining furnace again, where it is converted into market lead, is stamped with the proprietor's name, and is piled away ready for shipment. The residue from the desilvering furnace goes back to the smelting and thence to the cupel furnace, where the small percentage of lead still remaining is extracted, leaving the silver pure or nearly so. This is melted again in crucibles, to still further refine it; for although it comes from the cupel furnace 990-1000 fine, which is suitable for the purposes of the Mint, it is not fine enough for shipment to China, where the standard is 996-1000. The perfection to which this art may be brought is shown in one lot of 10,000 ounces, which assayed nine hundred and ninety-nine and three-tenths one thousandths fine.

General View of the Works.

Upon entering the works, the visitor is impressed with their extent and the amount of business transacted. A powerful engine carries the blast furnaces and crushing mill; and far and near, through the smoke, the heat of intense fires, the clash of iron implements, the glare of furnaces, and the clank of machinery, indicate a hive of industry, where science and labor are intelligently combined to unlock the treasures of the mine to the purposes of trade and commerce. Everywhere the attention is called to interesting and instructive processes. In one furnace we are shown about 6,000 ounces of melted silver. From others liquid lead is being ladled into molds placed in rows ready to receive it. Beyond, streams of red-hot litharge are being run from cupelling furnaces. In another direction pyramids of pigs of crude bullion are being carefully sampled, by clipping off with chisels pieces from the corners and edges. Further on a gang of men are piling up 1,200 pigs of market lead, weighing 115 pounds each—the results of one week's work. In a huge iron safe are stored quantities of silver in sheets and heavy fragments, ready for transportation to the United States Mint. Near one of the desilvering furnaces is piled a mass of silver "dross" (the residue which has been separated from the lead, and carrying from 1,200 to 1,500 ounces of silver to the ton), awaiting the process of the cupel furnace. The lead, after each melting, is run into pig-molds, and is conveyed to the successive furnaces by a system of miniature railroads, branching off in all directions to distant parts of the works.

The Assaying Department.

Following our conductor, we enter the assaying department, where exist all the most approved modern appliances for dispatch and accuracy. This department is a scene of scientific industry, in which many interesting experiments are made in furtherance of the object of the works.

Fluxes.

Situated over the main works, and reached by an inclined road, is an extensive platform on which are collected and arranged the various substances which are fed down as fluxes into the smelting furnaces below, in quantities as required—such as scraps and cuttings of iron and other metals, lime, and a general mixture of the by-products of the works—dross, agglomerated ore, etc., which are worked over and made to serve a profitable purpose.

Difficulties Originally Attending the Enterprise.

The remarkable success now attending the works was only reached through years of heavy outlay and careful study. The idea that smelting is a simple affair, requiring only the throwing in of the ore and the running out of the metal, is effectually dispelled after the examination of the intricate processes—the skill and experience required in the business. To an uninitiated spectator there is a strange fasci-

nation in these rills of liquid metal pouring from flaming furnaces—these pools of molten lead confined within margins of glowing masonry and reflecting like mirrors the delicate and ever-changing colors produced by the mysterious action of heat and chemicals. In these smelting works fourteen furnaces are kept constantly employed, and that number will be doubled as soon as the supply demands it.

Disbursements and Practical Results.

The most valuable ores are received from Arizona and localities too remote for any Eastern market to admit of shipment there, even were it desirable. The works take without hesitation all available ores that are offered. One firm in the neighborhood of Salt Lake has received \$40,000 for ores shipped by the Pacific Railroad. Another located in the southern part of the State has been paid upwards of \$100,000 for lead bullion. So extensive has the business become under the intelligent management of Mr. Selby, that his works have stopped the importation of lead to the Pacific coast as effectually as his shot-tower has driven all other shot out of the market; although in both enterprises he commenced against heavy Eastern competition and with the general prediction that the attempt would prove a failure. If the 1,200 pigs of lead, above stated as the result of a single week's run, were to be taken as the yearly average, the actual yield of the establishment would be 7,000,000 pounds per annum, or about one-sixth of the lead product of the United States. With the completion of additional furnaces, and the increased shipment of ores, the works will turn out an annual amount of lead far exceeding those figures.

Smelting Gold and Silver Ores.

Not only have the works grown into the largest producer of lead in the United States (of which the shipments of Mr. Naylor, in New York, will this year be 1,200 or 1,500 tons, constituting a valuable item in our home industry), but they are yielding silver bullion at the rate of \$30,000 per month, which is extracted from the lead, all resulting from the enterprise of one firm, and redounding largely to the credit of California. The growth of this branch has been such that furnaces especially for smelting gold and silver ores are about to be erected. These will also work up the jewelers' and mint sweepings, which, in the long run, is a substantial item; and there is no reason why the smelting of copper and tin ore should not be successfully carried on at the same establishment, which, if its transactions continue to increase as rapidly as they have done for the few years past, seem likely to rank with the well-known ones of England, Wales and Germany.

The San Francisco Shot Tower.

We have alluded above to the shot tower and lead pipe works, for the supplying of which with lead these smelting works were originally intended. This establishment, an engraving of which accompanies our sketch, is situated at the southeast corner of First and Howard street. It has been in operation about five years, and, like the smelting works was commenced by Mr. Selby under many discouragements, and was made a success only by heavy expenditure and untiring perseverance. The tower, which is 175 feet in height, is a prominent and well-known landmark in San Francisco.

Importance of the Lead Product.

While the yield of all other branches of mining on the Pacific coast has declined, that of lead mining has steadily increased, under the encouragement created by the persistent energy of one business firm. Of the 30,000 tons of lead annually used in the United States, less than 20,000 tons are produced in our own country. Statistics show that the home product has been lessening since 1862, while the annual consumption, and consequently the importation from foreign countries, is largely increasing. Thus, there is no danger of overstocking the market. The above amount, annually consumed in our country, is used in a multiplicity of ways; for lead pipe, lining of tubs, vats, etc.; soldering, preparing chemicals and dyes; bullets, type-metal; weights, plumbing for houses, steamships, etc.; pipe and sheet lead and shot, of which 12,000,000 pounds—and paints, including white lead, of which no less than 40,000,000 pounds—are annually manufactured and used in the United States.

Mors Ores Wanted.

This conclusively shows that the demand for lead must always be very great, and it should stimulate miners to make larger shipments of galena ores to San Francisco, to meet the additional facilities which these works are preparing for them. In-

stead of there being insufficient smelting accommodations for ores, as has been represented, the works are not supplied to their full capacity. Now that the Pacific Railroad has opened direct and cheap communication with the silver regions of the interior, mining communities who lack the capital to build their own reduction works can realize the assay value of their ores with the assurance of perfect accuracy and uniform regularity.

Metallurgy and Ores.

MINING SCHOOL.

Mosheimer's Practical Mining School
Will be reopened by the FIRST OF JUNE, and practical instruction given in all branches of Assaying, Crushing, Amalgamating, Concentrating, Smelting and Refining Ores; also Erecting Furnaces and Reduction Works of every kind. To give all miners a chance to learn Assaying of Ores (what everyone ought to) I have reduced my former charge for Assaying Ores.....\$ 50.00
To work Gold and Silver Ores..... 100.00
Smelting and Refining, including Assaying..... 160.00
Many gentlemen who have been taught in my establishment will bear testimony that in a few days they learned more than they expected to learn in a month. Before going into mining, every man ought to know how to test ores, and then he will go to work with prudence and never fail to be successful. Apply to
J. MOSHEIMER,

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea & Perrins have been forged, L and P give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester: Crose and Blackwell, London, &c. &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

WIESTER & CO., PATENT BROKERS, No. 314 Bush Street, San Francisco. PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

P. DAVIS' WIRE AND PICKET FENCE.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why bang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence, sent on application.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

WIESTER & CO.,

314 Bush Street, San Francisco.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 20, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, damped with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Climate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs; FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread; FOR humors on the Skin, or MILD COMPLEXIONS, or, in a single sentence, FOR all Diseases of the MUCOUS MEMBRANES, the Sore, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL OF MOUNTAIN BALM —AND— OREGON GRAPE,

Two Plants, abounding on the base of, and on the Mountains surrounding
MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, Fargo & Co's Express to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-12twr

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted \$2,500
Second—For the second best design and plan 2,000
Third—For the third best design and plan 1,500
Fourth—For the fourth best design and plan 1,000
Fifth—For the fifth best design and plan 500

The premiums payable in City Hall warrants. As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

Reading for the Hour.

First Railway Trains.

On Tuesday, the 27th of September 1825, the Stockton and Darlington Railroad was publicly opened. The road had been under construction over three years, and consequently the greatest interest was felt throughout England. Although locomotives had been in use for hauling coal wagons on colliery tramways over twelve years, comparatively few believed that they could extensively take the place of horses. On this road it was decided that horses should be largely employed. Nevertheless the directors ordered three of Stevenson's locomotives against the opening of the railway. How the road was opened, Smiles tells in his interesting biography of George and Robert Stephenson:

A great concourse of people assembled on the occasion. Some came from Newcastle and Durham, many from the Aucklands, while Darlington held a general holiday, and turned out all its population. To give eclat to the opening, the directors of the

left behind, and other wagons were taken on, with a hundred and fifty more passengers, together with a band of music. The train then started for Stockton—a distance of only about twelve miles—which was reached in about three hours. The day was kept throughout the district as a holiday; and horses, gigs, carts, and other vehicles, filled with people, stood along the railway, as well as crowds of persons on foot, waiting to see the train pass. The whole population of Stockton turned out to receive the procession, and, after a walk through the streets, the inevitable dinner in the Town Hall wound up the day's proceedings.

On the 15th day of September, 1830, the Liverpool and Manchester Railway was publicly opened. The completion of this railway was regarded as a national event and celebrated accordingly. Accounts of this opening have been published so often, that a description is unnecessary here.

The United States were not far behind England. On the 4th of July, 1828, work was commenced on the Baltimore and Ohio Railroad. In 1830 the Mohawk and Hudson Railroad, from Albany to Schenectady, was begun, while other lines were being constructed in Massachusetts, Pennsylvania and New Jersey. In 1840, 1,818; in 1850,

THE FIRST RAILROAD EVER BUILT.

company issued a programme of the proceedings, intimating the times at which the procession of wagons would pass certain points along the line. The proprietors assembled as early as six in the morning at the Brusselton fixed engine, where the working of the inclined planes was successfully rehearsed. A train of wagons laden with coals and merchandise was drawn up the western incline by the fixed engine, a length of 1960 yards, in seven and a half minutes, and then lowered down the incline on the eastern side of the hill, 880 yards, in five minutes.

At the foot of the incline the procession of vehicles was formed, consisting of the locomotive engine No. 1, driven by George Stephenson himself; after it six wagons loaded with coals and flour, then a covered coach containing directors and proprietors, next twenty-one coal wagons fitted up for passengers (with which they were crammed), and lastly six more wagons loaded with coals.

Strange to say, a man on a horse, carrying a flag, with the motto of the company inscribed on it, *Periculum privatum utilitas publica*, headed the procession! A lithographic view of the great event, published shortly after, duly exhibits the horseman and his flag. It was not thought so dangerous a place after all. The locomotive was only supposed to be able to go at the rate of four to six miles an hour, and an ordinary horse could easily keep ahead of that.

Off started the procession, with the horseman at its head. A great concourse of people stood along the line. Many of them tried to accompany it by running, and some gentlemen on horseback galloped across the fields to keep up with the train. The railway descending with a gentle incline toward Darlington, the rate of speed was consequently variable. At a favorable part of the road Stephenson determined to try the speed of the engine, and he called upon the horseman with the flag to get out of the way. Most probably, deeming it unnecessary to carry his *Periculum privatum* farther, the horseman turned aside, and Stephenson "put on the steam." The speed was at once raised to twelve miles an hour, and at a favorable part of the road, to fifteen. The runners on foot, the gentlemen on horseback, and the horseman with his flag, were consequently soon left far behind. When the train reached Darlington, it was found that four hundred and fifty passengers occupied the wagons, and that the load of men, coal and merchandise amounted to about ninety tons.

At Darlington the procession was rearranged. The six loaded coal wagons were

9,021; in 1860, 30,365; and 1870, over 50,000 miles of railway had been laid.

Our illustration to-day represents the trip made over the Mohawk and Hudson Railroad in 1831. The two carriages contained fifteen passengers, of whom, as far as is definitely known, the most prominent now living is Thirlow Weed. It is reported, however, that Thomas H. Benton, Henry Clay and Jefferson Davis were also on board the train. The engine was built at the West Point Foundry, N. Y., in 1831, and was named "De Witt Clinton," had wheels four and a half feet in diameter, a cylinder of 5½ inches bore and 16-inch stroke. The boiler was five feet long and had thirty copper tubes, four inches in diameter. The total weight of the engine was four tons. A representation of this train has been hanging for some time in the rotunda of the Merchants' Exchange in this city.

BISMUTH.—The *Druggists' Circular* is responsible for the following, which may be taken with a grain of suspicion:

The increased demand for this metal has occasioned the examination of new localities, and the search has, in several instances, been attended with success. A remarkably pure ore has been found in Peru, which, on analysis, gave: Bismuth, 93.372; antimony (with traces of tin), 4.570; copper, (with a little iron), 2.058—total, 100. The absence of arsenic and sulphur is noteworthy, and distinguishes this ore from the Saxon variety. Also, in South America, seams of bismuth have been found associated with copper.

MEANS BUSINESS.—There is a certain charm in the manner in which some one boldly puts up a sign on California street, going straight to the mark without minding the little details of orthography: "All kinds of Business sold on short notice." This is a free country and every one has a right to think and spell as he chooses. Besides, as Jones remarks, if "Business" doesn't spell *business*, what does it spell?

EARTHQUAKE AT GILROY.—Only a slight shock and reserved for this particular locality. Time, 8.25 A. M., July 9. Oscillation, from north to south. Duration, four seconds. No damage.

Sorcery in Alaska.

Our recent brethren of Alaska are addicted to sorcery to a certain extent. Dall, in his book on Alaska, gives the following example of the manner in which shamanism (as it is called) is practiced:

On the day appointed for the exhibition of the shaman's power, his relations, who act the part of a chorus of singers, are obliged to fast. Nay, more than that; they are obliged to use a feather as an emetic, and free themselves from such gross material substances as food. The performance commences at sunset and lasts till sunrise. All who wish to participate assemble in the lodge or hut of the shaman, where they join in a song, to which time is beaten on a drum. Dressed in his paraphernalia, with a mask over his face, the shaman rushes round and round the fire, which is burning in the center of the lodge; he keeps his eyes directed towards the opening in the roof, and keeps time to the drum with violent motions of his limbs and body. These movements gradually become more convulsive; his eyes roll till the whites alone are visible. Suddenly he stops, looks intently at the drum, and utters loud cries. The singing ceases, and all eyes are directed toward him, and all ears strained to catch the utterances which

The sale of spirituous liquors in Alaska is being attended with melancholy results. It seems that some of the population are leaving; at least the saloon-keepers are reported as anxious to retire. Only Ingerbeer is allowed. Massachusetts on the east and Alaska on the west of the continent are thus united by a bond of legislative prohibition. The *Alaska Times* thus complains:

"It is a pitiful sight, indeed, to witness the sad diminution in color that the hitherto ruby noses of our thirsty friends present. Could a few of our legislative Solons, who have but to choose their favorite brands from the cellars of Stetson or Leland, Willard or Delmonico, gaze on their forlorn and desiccated features, they would immediately cut the Gordian knot that binds the people of this Territory to a life of abstemiousness."

NEW WORK BY KUSTEL.—"Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver." Under this title Dewey & Co., of the Scientific Press, San Francisco, will soon publish an excellent work by Guido Kustel. The reputation of the author renders unnecessary any further recommendation of the work, which, it is said, will be a clear and complete treatise on these subjects, which are of so much interest at the present time. Miners and others will find it of great value. The various methods and furnaces employed in roasting, and chlorination and lixiviation with the different manipulations and apparatus, will be fully described, and amply illustrated, together with remarks on the various advantages and disadvantages of each process, and their special application on this coast.

We would be glad to see fifty copies of this work in the hands of those having charge of and interested in mining operations in Alpine. Kustel is on the right track, as time will show.—*Alpine Miner, Silver Mountain, Cal.*

The above work contains 120 pages, and the price is \$2.50 coin or \$3 currency.

MARAVILLA COCOA. For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to the finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalid use we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate, Steam Mills—Brick Lane, London. 5v20-ly

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

LAYRIS' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

MULLER'S Brazilian Spectacles are just the thing for people fond of reading whose eyesight is beginning to fail. His great skill as an optician enables him to suit all conditions of sight. It is Muller who supplies the city with opera glasses. *

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

are supposed to be inspired. These ceremonies comprise the whole art of shamanism among the Thlinkets. The spirits of the different classes appear to the shaman in different forms. By changing the mask he places himself *en rapport* with the spirit to which each mask is dedicated. It is believed that this spirit inspires for the moment all the utterances of the shaman, who is for the moment unconscious. After the ceremonies are over, first tobacco and then food are distributed to those present, and all is concluded.

AN INTERESTING COMBAT.—San José has always prided herself on her tarantulas, and her pride was to be brought low. About a week ago, Messrs. Gates and Rhodes received from Elko, Nevada, by mail, in a small box, four of the large black spike-tailed crickets, members of the grand army now devastating the Central Basin, and a division of which actually succeeded recently in stopping a railroad train, by sacrificing themselves beneath the car wheels on the track, until it became so greasy they would not revolve. These foreign heroes were received by Messrs. Gates and Rhodes, and, with a full knowledge of their bravery, these gentlemen still believed that they could be vanquished by tarantulas of home production. So they sent and procured four large tarantulas, put them in a large glass jar with the spike-tailed warriors, and the fight began. The spike tails made the first charge, and, sad to relate, notwithstanding the largest tarantula fought fiercely, they vanquished him, tore off his legs, disregarded his bites, and proceeded, without the least ceremony, to eat him, which operation they performed in quick style. The other tarantulas took to flight, and now no inducement will cause them to leave their own contracted portion of the jar, while the doughty spike-tails seem eager for another fray.—*San Jose Independent.*

ADVANCING CIVILIZATION.—A pleasing little discussion occurred in the Chicago Common Council, during which the blood of Alderman Cox boiled up to such an extent that it caneled that gentleman's hand to propel a bottle of ink at Alderman Dixon, whose clothes were blackened thereby to a considerable extent, as was also the reputation of Alderman Cox.

A mistaken tourist was found weeping over the ice-house at Mount Vernon, thinking he was dropping tears at the tomb of Washington.

New Mining Notices.

Cordillera Gold and Silver Mining Company, Chihuahua, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eighth day of June, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

IMPORTANT BOOK!

Now IN PRESS.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore."

Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book will contain 120 pages and be issued about July 16, 1870.

Price, \$2.50, coin.

SCIENTIFIC PRESS.—This paper is one of the most valuable published on the Pacific coast for miners, mechanics and farmers. It contains each week illustrations of new machinery, descriptions of new inventions and discoveries, information of scientific developments and mechanical progress, with valuable articles in relation to agricultural and farming interests. All claims of patents issued to inventors on this coast are published in this paper. We can recommend it to our citizens, and hope Mr. Murray may meet with success in obtaining subscribers among them.—Sonora Democrat

WONDERFUL
Scientific Discovery.
THE GREATEST EVER MADE.
Having baffled the Ingenuity of Chemists and Physiologists for Ages Past.
DR. CROWLY'S EMERALD HAIR BALM.

No EXAGGERATION, but a stern reality, verified by the undersigned:
Dear Doctor: I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly,
JOHN STAPLETON,
California street, San Francisco.
To W. J. Crowley, M. D., No. 20 Montgomery street, San Francisco. 1v21-1m

HIBBERD, SANBORN & CO.,

South Point Mills, Berry street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newsels and Balusters.

Greatest Discovery Ever Made.

MR. J. W. MAC, while a resident in New Zealand, was so afflicted with the RHEUMATISM, that for years he was completely crippled and unable to attend to business. The symptoms were of the worst type—knees painful and swollen, with sinews contracted; shoulder, arm and hand rendered useless, and accompanied with continued excruciating pain. While in this state of suffering, he got acquainted with a native of the country, who applied to the parts affected a composition spread on coarse canvas, the properties of which were so wonderful that in a short time all the pain left him, the swelling disappeared, his sinews relieved, and he was able to resume his usual avocations. So effectual has been the remedy, that to this day he has enjoyed perfect health, without the slightest return of his former complaint. Knowing the great blessing such a remedy would be to those afflicted with this painful disease, he with great difficulty and expense obtained the secret of preparing the Plaster; and during the many years MR. MAC has applied these Plasters in New Zealand, Tasmania, New South Wales, and this city, their effect has been marvelous, giving to the most painful and longstanding cases sure and certain relief. The most incredulous will be convinced by referring to these persons: B. W. Owens, 405 Front street; F. B. Alderson, Traveling Agent for Dewey & Co., 414 Clay street; James Flynn, 519 Mission street; Michael Gorman, No. 6 Front street; Mrs. W. S. Wright—late of Gilmore House—518 Folsom street, now agent at Virginia City; E. Shenley, corner Montgomery and Filbert streets; W. M. McLeod, Depository American Tract Society, 557 Market street, and a host of others, who all bear testimony to the unparalleled healing powers of J. W. MAC'S (rightly termed Magic) Plasters, for the cure of Rheumatism, Gout, Weak Loins, Tender Feet and Neuralgia. J. W. MAC may be consulted at his office, rooms Nos. 34, 35 and 36, 128 Kearny street, San Francisco, between the hours of 9 to 12 A. M., 2 to 4 P. M. and 7 to 9 P. M.

WHOLE WORLD
BUTTERFIELD & SWIFT
THEY ARE THE BEST! Why? Because the WEED Machines work easy, simple and with more YANKEE! Buy the LATEST always. Call and see S. E. Horr, 329 Kearny St. S. E. Horr.

DR. ABORN
Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Anzerals House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

DR. ABORN—I take pleasure in bearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and am myself now cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.
Oakland, June 3, 1870. WM. HOSKINS.

No Painful Operations.
Dr. Aborn does not subject his patients to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.
Hon. James A. Johnson, M. O., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have written upon their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1v21-2m

Best Illustrated Newspaper

—FOR—

PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to

Mining, Farming, Mechanic Arts,
AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the PRESS and illustrated Patent circulars sent free on receipt of postage stamp.

Machinery.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others—they bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

Mr. S. H. HERRING, agent for the Scientific Press, has called upon us, and is now in town. He informs us that the Press is rapidly increasing its circulation. We are pleased to hear it, for it is a journal that all should read. Valuable to farmers as well as miners, mechanics and others.—Pajaronian, June 18th.

Common Sense Compressed.—It is difficult to give in a dozen lines the reasons why TARRANT'S EFFERVESCENT SELTZER APERIENT should be preferred as a corrective and alternative to every other medicine in use. Firstly, it allays fever; secondly, it cleanses the bowels without violence or pain; thirdly, it tones the stomach; fourthly, it regulates the flow of bile; fifthly, it promotes healthy perspiration; sixthly, it relieves the system from unwholesome humors; seventhly, it tranquilizes the nerves; eighthly, it acts upon the blood as cooling; and lastly, it forms one of the most delicious cooling draughts that ever passed down the throat of an invalid on a warm summer day.

Time Tests the Merits of all things.—For Thirty Years PERRY DAVIS' PAIN KILLER has been tested in every variety of climate, and by almost every nation known to Americans. It is the almost constant companion and inestimable friend of the missionary and the traveler, on sea and land, and no one should travel on our lakes or rivers without it.

It is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, and is admirably suited for every race of men on the face of the globe.

Be sure you call for and get the genuine Pain Killer, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine.

23p Directions accompany each bottle. Price 25 cents, 50 cents, and \$1 per bottle. Sold by all medicine dealers. 23v20-1m

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—New Age.

RIDER'S

Automatic Cut-off

Vertical Engines

Manufactured by the
Albany St. Iron Works,
NEW YORK.

These Engines are simple, compact and durable, and in point of economy of fuel and space are excelled by none, and are cheaper than any other first-class cut-off Engines in the market. Descriptive pamphlets and price lists mailed free on application to the proprietors, HENDREN & RIPLEY, Corner Albany and Washington Sts., New York. 26v20-3m16p

RIDER'S GOVERNOR CUT-OFF ENGINE,

Manufactured by the DELAMATER IRON WORKS, WEST THIRTIETH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more care than common engines. NOTE.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application, 26v20-3m16p

Mann's Patent Earthquake (and Fire) Proof Chimney.

This invention affords a real improvement, which is much needed in this section of country, and as it is just as cheap, can be built more quickly, with less trouble and always perfect, it is very desirable and likely to supersede the old style of chimney.

The chimney is constructed entirely of metal. The lower portion, made of cast, sheet or boiler iron, with a proper opening for a fire-place (which may be built of brick), is of any suitable shape and is intended to rest upon any foundation or upon the floor, if desired, as the whole weight of the chimney will not exceed six or seven hundred pounds. The left-hand figure shows the general appearance of this lower portion. On the right is the chimney-flue, shown in section also, in the middle figure, and below this, is the cover for the lower portion.

The flue is cylindrical and consists of two pipes, one inside of the other, with the annular space between them filled with cement, plaster of paris, asbestos, or other non-conducting material. This flue is secured to the cover, which is fastened to the lower portion of the chimney by rivets or other proper means. The illustration shows the device with one fire-place and one flue. But it can easily be constructed for two fire-places, opening into adjoining rooms on opposite sides of the chimney.

The chimney may be placed directly on the floor, if necessary, and any suitable fire-proof fire-place can be constructed in the recess in the lower portion. Heating stoves may be connected with it at any point, and thus the heat is utilized for warming rooms to a very great extent. It is so light that it is quite applicable when a fire-place is needed only in the upper story or stories of a building. The exposed part of the iron can be painted so as to represent brick-work, or ornamented as desired.

Besides this possibility of a cheap and easily-constructed chimney which can be placed in any room, are to be added its fire-proof qualities. As the pipes are made breaking joints, there is no danger of fire should the chimney be racked. This is a point of no small importance.

It cannot be shaken down by an earthquake unless the house comes down with it.

It is absolutely fire-proof, as it is impossible by this construction to have such a thing as a defective flue. It does not take up one-half the room of a common chimney.

These chimneys can be constructed of different sizes and styles and kept on hand for sale, so that they can be ordered and set up at once, greatly facilitating rapid building in the country or city.

The inventor offers part of the patent right for sale. He will contract for chimneys on liberal terms. Address the inventor and patentee,

2v21-1m BENJAMIN F. MANN, Oakland.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Bentzen Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; beats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible Co.—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.
Eagle Brass Foundry, 206 Front street, San Francisco.
12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street.—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore.

Messrs. A. S. Hallidie & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them as perfect to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

OALLAHOER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs. A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint I have always preferred the Crucible of Dixon's make over Adams, Gaudier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors. Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1.—CHEMISTRY AND MINERALOGY. 2.—CIVIL ENGINEERING. 3.—MECHANICAL ENGINEERING. 4.—MINING ENGINEERING AND METALLURGY. 5.—AGRICULTURE. 6.—NATURAL HISTORY AND GEOLOGY, and 7.—SILICOR COURSE. Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks. The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive. For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. v16-1y16p

The War in Europe.

The topic of the day is of course the war between France and Prussia. The antagonism between the two people has at last come to an open rupture. To-day the Frenchman and the German stand face to face in deadly combat.

As to which party will conquer no one can now speak definitely. Both are powerful and well prepared. Prussia is, by her system, a nation of soldiers. Every Prussian is compelled to serve three years (or if he can pass the proper educational examination, and pays his own expenses as "volunteer," one year) in the regular army, four years in the reserve, and another period in the home guards. The Prussian army is said to number about 780,000, including a reserve of some 150,000. The whole of North Germany will be a unit against the French. On the other hand, France is by no means despicable. She can muster, it is said, an available force of some 700,000 men. She is burning to take the Rhine provinces, and is animated with a spirit of intense feeling. Against her enthusiasm is opposed, however, an equal one on the part of the Germans, who, however, are individually better educated.

Mere numbers, however, will have but small weight in this contest, where generalship will be more decisive. The Prussians have had an excellent training in their late wars, by which the French also, it is fair to believe, have profited. But the closer we look into the matter, the more incompetent we feel ourselves to say which will conquer.

Then another question arises:—how long will the war last? Will there be a settlement after one battle, or will the other powers intervene, or will there be a general European conflict? Time alone will answer these queries. One can only guess at present.

If France whips decidedly, then Germany will be resolved back into a number of small and separate States. If Prussia whips, probably the Orleans family will ascend the French throne. Although one might think that the other nations would desire to see the dismemberment of Germany, yet Napoleon has managed so poorly, or Bismarck so well, that the sympathies of the majority are with Prussia. Even Austria, although hating Prussia, is still sore against France on account of her inaction in 1866.

The principal effect in California will be to raise the price of wheat. Even now it is hard to get hold of this article at any reasonable prices, as parties are holding on to it for higher rates. Cotton, it may be remarked, will be unfavorably affected, and is falling rapidly; an important item as regards exchanges. The shipping interest will have now a chance for a revival.

The lecture on the Influence of Climate, last Saturday evening, before the Mechanics' Institute, was delivered by Dr. Rowell, and was most interesting.

Road and Tramway Engines.

It has been urged at times that, in the long level stretches on our Western coast, steam could be used in the place of animal power, with great success. Hitherto but little consideration has been given to this subject in our country. The English, however, have paid special attention to the matter of road and tramway engines, and

One of the tramway engines very generally used is that shown in the first figure. This is Aveling & Porter's patent. These engines are made from four to forty horse-power, to meet all requirements. The motive power is applied to the wheels by a chain-gear running over a wheel on one end of a counter-shaft, which is connected by spur gearing to the crank-shaft. The crank-shaft is provided with a fly-wheel,

AVELING & PORTER'S TRAMWAY ENGINE.

have introduced them into use in many parts of their country. Originally tried at the collieries, these have gradually become more and more general, and horse power

and the counter-shaft bearings are in curved slots in supporting brackets, so that the chain can be tightened when necessary. The total weight of a ten-horse-power en-

AVELING & PORTER'S ROAD AND AGRICULTURAL LOCOMOTIVE.

has now been replaced by steam-power in a great number of instances. This has been done, however, only after many and repeated experiments, by which the economy of the measure has been clearly demonstrated. Under these circumstances, and considering that road engines are made which will run over rough roads (at least this has been asserted repeatedly), it might well be thought that on our plains and in some of our large mines, machines of this kind might be used with advantage. And, as we hear, one road engine at least will be tried on this coast.

gine is nine tons. The cost in England of taking heavy loads at the rate of six miles per hour is given as 1½ cents per ton per mile. These engines are superior to the common portable and stationary engines for driving fixed machinery of every description.

The second figure shows the patent road locomotive engine, made by the same firm. Trials with single and with double cylinders have demonstrated that for general purpose there is a gain in power, simplicity and efficiency by using a single cylinder and reversing gear when con-

nected by the patent chain-gear to the driving axle. There is a double gearing arranged for a speed of two and a half, or one of five miles per hour. The cylinder is surrounded by a steam jacket, inside of which the steam pipes are brought up, the throttle-valve being at the top of the cylinder. This prevents priming on steep grades. The working parts are protected from dirt and weather by a housing. The driving wheels, which can be worked separately for better turning sharp corners, are six and a half feet in diameter and a foot and a half wide. On their faces there are spaces which hold small castings on ordinary ground; but when the soil is very soft, these are removed and angle-iron paddles substituted. The steering device is represented as perfect.

The agricultural locomotive is merely an adaptation of the last for the purpose of the farmer. The boiler is made larger, clothed with hair-felt, lagged and covered with sheet iron. Otherwise, it is essentially the same as the road locomotive.

Messrs. Aveling & Porter have been awarded for their engines the first prize medals at the International Exhibition, London, 1862; Hamburg, 1863; Odense, Denmark, 1863; Königshurg, Prussia, 1863, and the Universal Exposition at Paris in 1867. They have met with such success in Europe that they have established an agency in New York, with a view to introducing their engines into the United States. We see that last month one of their agricultural locomotives was shipped to New Orleans. Their agent is W. C. Oastler, No. 43 Exchange place, New York, who will, on application, be ready to give any further information desired.

THE last day of the session, Mr. Sargent's bill, giving preemption settlers three months after the filing of the plans of survey in the local land office, in which to file declaratory statements, passed both Houses. This is for the purpose of securing preemption claims from forfeiture; and under the Colorado law, as amended by the Senate, gives settlers eighteen months after filing to pay for their claims. A large amount of business, including the Australian steamship subsidy and the Texas Pacific Railroad bill, goes over until the next session.

TERRIBLE FIRES.—We have had some terrible fires on this coast, lately. Gold Hill wound up its Fourth of July celebration by a wholesale fire. Now comes the statement that on the evening of the 18th inst. a conflagration at Dayton destroyed the entire business part of the town, consuming forty five buildings. And the same night, according to accounts from Oroville, the town of Magalia, or Dogtown, was burnt down.

PRESIDENT MARK HOPKINS, of Williams College, one of the most prominent of College Presidents in the United States, and author of the "Evidences of Christianity" and other works, is now visiting California.

Communications.

Mines and Smelting Works of Inyo Co.

[Written for the Scientific Press.]

EDITORS PRESS:—This letter shall treat of operations and results of the different mines and mining works of the whole Owens River country. The Owens Lake Silver Smelting Company's works are situated on the eastern shore of Owens Lake, about eight miles from Cerro Gordo, and consists of two reverberatory furnaces and one blast furnace of the capacity of the one I described in my last paper; the whole driven by a forty-horse-power engine. In sinking a well about six weeks ago, to supply the boiler with water, at the depth of ten feet from the surface an artesian or underground stream of water was struck, which overflowed and still continues to overflow, and runs off in a quite large rivulet, until it loses itself in the sands surrounding the works. The ores are freighted from the mines in Cerro Gordo. Wood and charcoal are brought across the lake in a flat-boat from the Sierra Nevada, at the Cottonwood Cañon, a distance of fifteen miles. The company consists of gentlemen in New York and is under the superintendence of Mr. Jas. Brady, who is now shipping large amounts of bullion monthly. During the month of May Mr. Brady shipped for Los Angeles 2,000 bars, and he has made various shipments this month, but as to the exact amount I have no reliable authority.

Next in rotation comes the Eclipse, situated on the eastern bank of Owens river, ten miles southeast of Independence, owned by a large English firm, and under the superintendence of Capt. Jas. Barrett. This company have but commenced work. They are engaged in laying a tramway to the mine, four miles distant from the mill-site, and of course have no results.

The Chrysopolis Mill and Mining Company's property has changed hands, and the new company has dispatched a superintendent to look to the re-starting of the works, of which more anon.

Fish Springs is a gold mining camp situated on the western side of Owens Valley and river, twenty miles north of Independence, and is worked entirely by arastras. The mines have been worked with success for three years, although the veins are very small, not averaging more than six inches in thickness. The principal works, owned by Mr. Max Murray, are arastras driven by water-power, and are situated in and surrounded by a fine farming country, with wood and water in abundance.

Kearsage district is situated west of Independence in the Sierra Nevada, and fifteen miles distant. It contains three mills, one of four stamps, one of five stamps and another of ten stamps, and ledges innumerable, two only having been worked to any extent. The Silver Sprout mine is situated at the top of the Kearsage mountain, 12,000 feet above the level of the sea. The company owns a 5-stamp mill, containing three Wheeler pans, eight Knox pans, two large settlers, and a large oxidizing furnace. The mill is run by a hurdy-gurdy water-wheel, nine feet in diameter, and has power enough to run five additional stamps, which were intended, when the battery was built, to be added. This company for some cause is not running this summer.

The Kearsage Mill and Mining Company own a ten-stamp mill, which is running during the daytime at present, on ores that average \$70 per ton, and, as I have been informed by the Superintendent of the mill, the mine is yielding abundance of such ore. This mill is driven by steam-power, and is so situated that it can be run by water at any future time. The Alabama gold mines have remained in statu quo for the last two years, although when last worked they paid exceedingly well.

Messrs. Wolfskill & Co., of Los Angeles, have erected, two miles west of Lone Pine, large smelting works to be run by water-power, but as yet have not begun their operations. They intend to work upon Cerro Gordo ores.

Another series of furnaces are probably to be built on Cottonwood creek, of which, when in running trim, I will give you a description.

CROWQUILL.

Independence, Inyo Co., June, 1870.

Mining in El Dorado County.

[Written for the Scientific Press.]
Greenwood Township.

EDITORS PRESS:—Since my last letter I have wandered considerably over the county. At Greenwood, Neggle & Co. have several claims which are called seem diggings. One, the St. Lawrence, was opened last December by cutting through the rim rock of slate, some ten feet deep, when they struck porphyry and quartz, with more or less gold well distributed through both, the porphyry being soft enough to be easily washed by water through hydraulic pipe. The gold is ragged, much of it of a dirty harnt color and quite fine. The lead is about 400 feet in width and is worked to the depth of 150 feet. I was informed that their receipts were from 10 to 52½ ounces per week. The French claim, in which Neggle has an interest, is located on the same seam, several hundred feet to the northwest of the St. Lawrence, and has been productive for several years. A few days before my visit the company exploded some thirty kegs of powder in a tunnel dug for that purpose, with excellent success, loosening and shaking the ground so that the hydraulic washed away the dirt with wonderful rapidity. The Spanish claim, owned by Frank Curtis & Co., I was informed, has every prospect of success. Brown & Co., further north on the same lead, had, after months of perseverance and hard labor, struck pay in large quantities; but it was intimated that huzzards are hovering over, ready to pounce upon it if successful. Therefore, but few facts could be obtained.

At Pilot Hill, in the same township, quartz has been found high up on the hill, containing rich pockets of gold, the quartz being in porphyry like the late discoveries near this city. Six hundred dollars were taken out the first week in June. The huzzards have already commenced picking at the discoverers of the claim, notice of a suit at law for possession having been served on the occupants.

Placerville Township.

In this city and vicinity the mines continue to give down. Fisk is at work, but with less success than at first. Lewis & Alsberg have struck fine gold-bearing quartz 100 feet further up the hill, this being cross-wise of the vein. Hodge & Lammon have a pay-streak some thirty inches wide. They are working along the lead and have taken out from the surface to the depth of some thirty feet; blasting is resorted to. The claim is fabulously rich and it will take years to work it out. I am informed that Reed & Jaycox, south of Fisk, have fine prospects. The four last mentioned claims are located on the same vein. Kinney & Co., on the south side of the city and in a line with those on the north, is said to be rich, but as huzzards are beleaguering it, but little information can be obtained of what it produces. Gillett & Reed's claim, south of Kinney & Co., is remarkably rich, so I am informed by the owners, and specimens exhibited show hard quartz and the gold beautifully distributed through it. The Hook and Ladder, a hill claim spoken of in a former communication, is showing great richness. A few days ago one of the owners struck a dark gray cement, quite soft; taking his pan to prospect and seating himself in a convenient position, he did not leave the place until he had picked eleven ounces of the "filthy lucre" called gold into his pan; about one hour's work. This same streak has been found in the Blacklock & Co's claim, some thousands of feet from the Hook and Ladder company.

Poverty Point, situated between Big Cañon and the South Fork of the American river, one mile north of this city, has been worked more or less since 1852, principally by quartz miners, there having been five or six quartz mills built on and removed from this point of less than one and a half miles square. One of the last mills was built and worked by Joseph White & Co., but not with success. Van Hooker and others lately found pockets in the porphyry of great richness. Napier & Truett, a few days ago, procured a small head of water and commenced washing to discover a vein of quartz which they had the faith to believe ran through the hill. On Wednesday the 29th, after their water had nearly dried up, they were examining the water-course, and, like magic, the quartz and gold loomed up before them. They took out on that day what lookers-on claimed to be more than \$1,000, which was probably near the amount, for I am informed that \$600 has been pounded out and there remains considerable for the mortar yet. One specimen is valued at more than \$100. A considerable amount of fine specimens was taken from the claim on Thursday, as your correspondent can vouch for. Below this claim, on the South Fork, is situated Kanaka Bar, from which enormous chunks of gold were taken out in 1850, 1851 and 1852, weighing from three to more than eleven pounds. I saw the chunks at the time they were taken out, but then money was plenty and it created but little excitement. Napier is of the opinion that some of the big chunks yet remain in the hill for him to pocket. The Pocahontas Company, near Hind Springs, have come upon a fine lead of rich quartz, a specimen of which was shown me last week by Mr. Burlingham, one of the owners. "Shepard & Co's quartz mill, on Oregon Hill, is at work again. It was feared that their lead had "petered," but a new discovery shows that they have only been at work on a spur of their main vein. On examining the "gouge" which lies between the vein and wall rock usually,

they found instead of wall rock the main vein, which is more than eleven feet wide, without bottom, top, or end being in sight. Quartz sufficient to run their mill for months is in sight.

Diamond Springs.

A rich vein of quartz has been discovered about one mile southeast of Diamond Springs, by a German, formerly an engraver for some of the early money-coiners of San Francisco. Buzzards are here, I am informed, seeking to devour the owner and appropriate the discovery. When will this system of adverse claimants cease? Will Sargent's bill for the sale of the mineral lands remedy the evil?

The excitement of the day is ditch, a bill having been introduced in Congress to donate land for that purpose. A subsidy of that kind to the right parties would be hailed with joy by the community, as it would certainly result in a full supply of water for irrigation and mining.

In a future letter, with your permission, I may have something to say on ditches and canals, past, present and prospective in this county. [We are always happy to receive opinions from the miners on such subjects.—Eds.]

E. N. S.

Placerville, July 11th, 1870.

Notes from Idaho Territory.

[Written for the Scientific Press.]

Boise City.

Boise City, the capital of Idaho Territory, is 300 miles to the northwest of Salt Lake City and 450 miles to the northeast of San Francisco. It is situated on the west side of Boise river in a beautiful location and at an altitude of 2,800 feet above the sea. It is well laid out, and has two large hotels, two National Banks, a Government assay office, three flour mills, two distilleries and a Penitentiary; besides it supports several newspapers—one tri-weekly, two semi-weekly and one weekly. It has been for years a trading-post of the Hudson Bay Company, and is now the central point of stage travel, and through it pass all the supplies for Boise Basin. It is the largest place in the Territory, being, I find, larger than Silver City, as I previously stated.

I am informed that this valley is about 50 miles long with an average width of 5 miles, although it widens out in places to an extent of 15 or 18 miles. It is a fine agricultural spot and prosperous, owing to the combination of its farming and mining resources. The crops look well this year and promise to yield largely. I have been told that hundreds of acres in the Boise Valley have been taken up and are now under cultivation, and that the returns made by the farming districts have always been very good; and they will be better than ever this season according to present appearances. The miners also predict a good year in their line.

The Boise City Flour Mill, owned by C. Jacobs, is located to the west of the city. It is run by water-power, the water being supplied from a ditch which leads from the river through the town and from which all the gardens are supplied. The mill has two large stones and runs six months in the year. Last year it ground some 25,000 bushels. Near by is a distillery, which in the past year (1869) manufactured 15,000 gallons. Mr. H. P. Issacs also has a very large distillery and a flour mill.

The Idaho Penitentiary, now being built, is situated two miles east of the city, at the foot of what is known as Table Mountain. The contractor and builder is Mr. C. May, formerly of London, England, who came here in the early times and built the first brick building erected here. The Government Superintendent is Mr. Donaldson, and the foreman is Mr. H. S. Wolf. Mr. May obtained the contract for \$35,000. He has the reputation of being a very energetic and skillful workman. The complete building will be 180 by 44 feet, but the present contract is only for one wing 70 by 40 feet. The building will be principally of granite and will contain in all 42 cells on a model plan, well ventilated, with hot and cold air. The wing now being constructed was commenced on the 27th of June and will be finished by the 1st of October.

I also visited the grounds where the U. S. Government is to build a large assay office, the specifications for which I send you. The General Superintendent is the Hon. John K. McBride, formerly of Oregon, who has just come on from Washington to commence operations. The appropriation is \$75,000 but the Superintendent tells me he thinks it will cost only about \$60,000.

Boise Basin—Its Discovery.

Boise Basin is about 36 miles from Boise City. To get to the different mining camps in the "Basin" (as the miners here call it) one takes Pinkham & Co's stage line. Here, with steep hills on each side, are located Idaho City, Centerville, Pioneer City, Placerville and Granite Creek, all lively towns indeed in certain times of the year. The first one I came to was Idaho City, on Moore creek, the county seat of Boise county, and a fine placer mining camp. There are several churches, a court house, a branch agency of the Bank of Boise City, doing a fine business in buying gold dust and making exchanges for the miners, Wells, Fargo & Co's Express office, etc. The buildings are mostly wood. By the way, I may mention that, as I am informed, Meredith & Co. cleaned

up from their claim near this place some \$17,070 after a run of 45 days.

Before 1862 (this and the following items I get from a letter in the Idaho Times) but little was known of the mineral wealth of Southern Idaho. That summer a prospecting party of six found their way up the cañons of Moore and Grimes creeks, but when about six miles above where Pioneer City now stands, a party of Indians attacked them, killing one of their number, Mr. Grimes. The rest retreated to Walla Walla, raised a large company (of 52 men) and returned to this region. They camped at Pioneer City, where a fort was built for protection against the red-skins. Others came to the spot and located near Centerville. Considerable fault was found with the number and size of the claims made by the Pioneer City miners, and the name of *Hog'em* was applied to that place. The bar on which Idaho City now stands was soon discovered by a party, who first concocted a bear story to keep off others; hence the name of *Bear Run* applied to the gulch here. In June, 1863, some of the miners made a trip up the North Fork of the Boise river to Rocky Bar, in Alturas county. The districts of Southern Idaho were most speedily populated and developed, and one year from the time the first party arrived, there were 5,500 votes polled within the limits of Idaho. Since that time the number has fluctuated and decreased somewhat.

Centerville—Pioneer City—Placerville.

After stopping at Idaho for a few days I went to Centerville. This is, as its name indicates, the central point of the mining towns, being 10 miles from Idaho City, 5 from Pioneer City, 6 from Placerville and 9 from Granite Creek. There is a strong feeling that this ought to be made the county seat, instead of Idaho, on account of its location. To get to Idaho City people from these other places pass through Centerville, and they might as well be spared the extra journey of ten miles, and then they would be able to return home the same day.

I have visited some of the large mining claims and found the boys piping away merrily. The large claim of Messrs. West and Laws, on Bumner Hill, has paid and will pay handsomely. Near this is the large claim of Mr. L. Law, which employs 16 men. The flume is 2 feet wide end 800 feet long; work can be done, however, only two or three months in the year on account of the short supply of water. The bed-rock is granite, the top of which is decomposed and is washed down by the miners. In this town I see the Masonic fraternity have a fine two-story building, which, when completed, will cost \$8,000.

Five miles due north is Pioneer City, or *Hog'em*, as you please. Here I find many of the miners busy at work getting out the *oro fino*. This camp has a population of some 500 persons and looks prosperous.

Going back again to Centerville we go off six miles west to Placerville. Here I found the miners hard at work, as the water was about giving out. Many of the claims here are worked out and some few large ones are paying well. The ditch here cannot accommodate all and so the large claims have the preference. There will be enough water for these for a few weeks longer, and then there will be a general clean-up and some handsome sums realized.

W. H. M.

Boise City, June 30, 1870.

[TO BE CONTINUED.]

THE NEVADA SODA MINE, says the Carson Appeal, which is situated about 60 miles hence on the old Reese River road, proves to be a more extensive deposit, and consequently a greater fortune to its proprietor, than was at first supposed. It is in the midst of a great desert—the lower portion thereof—is about seven acres in extent and of unknown depth, having been prospected in the pure article, with but slight interruption, down 18 feet. At a depth of a few feet the soda is quarried with sledges and wedges, being more solid than ice, which in some respects it resembles in appearance. The supply would seem, from present prospects, to be inexhaustible, as the article is in constant process of formation. In the spring the mine is frequently several feet under water. We are informed that the quartz mills supplied with ore from the Comstock lode use about 20 tons of this soda per month, at a cost of about \$80 per ton.

MANCHESTER, England, has lately had a cooperative Congress, at which the following statistics were furnished by a gentleman named Nuttek: In 1860 there were 150 cooperative societies in England; in 1862 it had increased to 330; and at present the number is 1,000. In 1864 the number of members did not exceed 100,000; it now numbers about 250,000. The annual trade now done amounts to about \$50,000,000. He stated that the wholesale society in Manchester did an annual business with the Manchester and County Bank amounting to \$5,000,000, and the societies with which they transacted business did a trade amounting to about \$20,000,000.—Exchange.

URANIUM IN WALES.—Oxide of uranium has been discovered on the Wheal Edward lode, and it is thought that it can be extracted with profit. The London Mining Journal states that uranite was found on the Great Wheal Edward lode (in the same mine) during the former working about forty years ago.

Mechanical Progress.

Steam Saw-Mill for Siam.

Engineering for June 24th describes a complete establishment now building in London, for teak-sawing in Bangkok, Siam. "The machinery comprises two large circular cross-cutting machines, four timber frames—the smaller being adopted for logs up to 24 inches; and the larger for logs up to 42 inches—two 42-inch self-acting rope feed saw benches with carriages and rails; two double edging benches and a 62 inch rack circular saw bench with self-acting traveling table. Besides these there are also two saw-sharpening machines, lathes, two travelers, etc. The whole of the machinery is driven by a 30-horse power horizontal condensing engine worked by two boilers of large dimensions adapted for burning sawdust, etc., an extra boiler being provided in case of emergency. * * Each frame is made sufficiently strong to carry a saw to every inch of width, at the same time margin is allowed for a greater number. The feed motion for the timber is obtained by means of Worssam's patent silent frictional feed wheel, which is a great improvement over the old ratchet. Every part of the machine requiring strength, such as the connecting rods, crossheads, cranks, and crank-shafts, is made of wrought iron or steel. The carriages of the roller feed frames are fitted with a lateral motion to adjust the saws for cutting crooked logs. The cross-cutting machines consist of large circular saws revolving on spindles, in journals affixed to carriages, which may be worked two and fro by a rack and pinion arrangement actuated by a band wheel. The larger of these machines carries a saw 7 feet 6 inches in diameter, and the smaller one of 6 feet in diameter. * * The saw-sharpening machines are introduced to lessen, as much as possible, the cost of files and labor. Files are almost entirely dispensed with, and replaced by discs of consolidated emery. Each disc revolves on a spindle carried by a counterbalanced arm which can be set at various angles to suit the form of tooth required, and for gulletting, topping, beveling, etc. The lathes are placed in the repairing shop, which is also furnished with a drilling machine, smith's forge, anvils, vices, and sets of hand tools. The two travelers are capable of longitudinal, lateral, and vertical motions, and have a lifting power of 6 and 10 tons respectively."

CUSHION-SLEEPER FOR RAILWAYS.—A new form of permanent way designed by J. Gregory is illustrated by *Engineering*. Iron sleepers have rests for the rail three inches above their surface. "Wooden wedges or cushions cut to the angle of 1 in 20 are driven in beneath the rail and upper part of the sleeper, half jaws and double-headed wrought-iron keys holding the rail in position. The wedges cannot work out of place, serrations on the upper part of the sleepers where they are driven preventing this. The weight of each sleeper is 80 pounds, with a surface of about 2½ square feet, their dimensions being 2 feet 1 inch by 16 inches; the wedges are 20 inches wide and 3 inches thick; with five of these sleepers to a 21-foot rail, it will be supported by 10 feet of bearing on timber. The rails are put into the half jaws, the wrought-iron hooked keys inserted within recesses, the rail is prized up by levers, and the wooden wedges or cushions driven tightly up from the outside."

TRANSFORMATION OF CAST IRON BY ALKALINE METALS.—The *Engineer* for June 24th gives from the *Moniteur Scientifique* the particulars of the process of MM. Girard and Poulain. We quote: "In order to cause the vapors of sodium and potassium to act on cast iron in fusion, we heat one of the former metals in an iron retort to 392 deg. or 482 deg. under a pressure of five or six atmospheres. When this heat is reached we direct the vapor thus obtained into the heart of the iron in fusion; the mass swells, and an alloy of the iron is the result. These alloys, although very hard, are malleable, and may be forged and welded. They oxidize rapidly in air or water, and are easily decomposed if a current of air, steam, or carbonic oxide is injected into them when in fusion. By these compound effects of the vapor of sodium and of air, for example, the whole of the metalloids in the iron are attacked, and the final result is pure wrought iron that can be hammered and welded with ease. Under certain circumstances the metal may present the properties of steel."

HYDROSTATIC WEIGHING MACHINE.—We find the following in the last number of *The Engineer*: "The principle of Mr. Duckham's machine is very simple, and consists in the filling of an open-top cylinder with water, or oil by preference, and suspending the machine to a crane. A piston passes downwards through the cylinder and terminates in an eye, to which the articles to be weighed are attached. The machine is connected with a dial gauge, the indicator of which is worked by the liquid displaced from the weigher. On the load being removed the liquid is returned to the machine. A peculiar merit of this machine is its lightness, an 84-pound weight machine being equal to weighing ten tons. Others much lighter are capable of performing very delicate work, and others again can be made proportionate in weight, which can weigh up to 100 tons. The machine has been tested, in weighing the armor plates of the iron-clad turret-ship *Abyssinia*. These are from eight inches to ten inches thick, weigh from seven to ten tons each, and are shipped and weighed by one process—lifted, slung and weighed all at once."

"DOMESTIC" STEAM ENGINE.—M. Fontaine has designed a small engine as a motor for domestic use. A specimen was exhibited at the recent *Conversations* at the Institution of Civil Engineers. *Engineering* says: "The apparatus consists of a small vertical boiler, heated by several Bunsen burners, the supply of gas to these burners being governed by a simple automatic arrangement dependent for its action upon the pressure of the steam. Thus, as this pressure rises the supply of gas is diminished, the adjustment being such that practically the steam is maintained constantly at any pressure to which the apparatus is set. The engine, which is of very simple construction, is carried by the boiler, and the latter is of such capacity as to contain sufficient water for a day's supply. In using the apparatus all that is necessary is to charge the boiler in the morning and light the gas, and the engine will run the whole day without further attention."

LORD ROSSE'S POLISHING POWDER.—The method of preparing the powder used by Lord Rosse, for polishing the speculum of his great telescope, is thus described by him: "I prepare the peroxide of iron by precipitation with water of ammonia, from a pure dilute solution of sulphate of iron. The precipitate is washed, pressed in a screw press till nearly dry, and exposed to a heat, which, in the dark, appears a dull low red. The points of importance are, that the sulphate of iron should be pure and the water of ammonia should be decidedly in excess, and that the heat should not exceed what I have described. The color will be a bright crimson, inclining to a yellow. I have tried both potash and soda, pure, instead of water of ammonia, but, after washing with some degree of care, a trace of the alkali still remained, and the peroxide was of an ochraceous color and did not polish properly."

CYLINDERS IN NARROW-GAUGE LOCOMOTIVES.—An exchange describes a new arrangement which is spoken of as especially applicable to locomotives on narrow-gauge railways: "The steam cylinders are placed one above the other in a center line between the driving-wheels, the piston-rod from one being connected by the connecting-rod to the crank of the front driving axle, and that from the other to the crank of the hind axle. The cranks are placed at right angles. By applying the power to both cranks in a central line between the rails, the tendency of the engine to oscillate is removed; whereas in the ordinary mode of applying the power first on one side and then on the other, the strain is constantly in opposite directions, and the flanges of the driving-wheels are moved more or less towards the rails, thereby producing oscillation."

IMPROVED WATER METER.—A Glasgow inventor's device is thus described: "The improvement admits of a comparatively small meter being used, the supply-pipe being fitted with a small branch, which leads a portion only of the liquid through the meter, whence it passes on by a small pipe into a small cylinder provided with a piston, and having an outlet slit in its side. The piston moves a large valve through which the main portion of the liquid passes, and proportionately opens the outlets from the meter and from the supply-pipe."

Scientific Progress.

Circulation of the Latex in Plants.

Dr. H. C. Perkins, of Newburyport, sends the *American Naturalist*, for July, some notes of his observations with the microscope upon the circulation of the latex, or the milky fluid which in plants seems to correspond to the lymph in animals. His experiments were upon a leaf of the *Chelidonium majus*; and he adds in a note at the end that he observed the same phenomena in the dandelion. The young leaf was placed between two strips of glass, upon which a drop of glycerine had been put, its underside uppermost on the stage of the microscope, so as to throw a strong light upon it from the mirror below. We quote: "While watching the circulation as seen through the lenses in the reflected sunlight, if I move the diaphragm from left to right, so as to make the shadow enter upon the right of the field of view, a brisk circulation (no matter how quiet it had been before) is instantly witnessed, which appears to be changed in direction as we move the diaphragm back again; and that the direction of the circulation can thus be changed at will by the interception of the sunlight. This same result can also be witnessed by the passage of clouds between the sun and mirror. The actual direction in the plant is from the apex of the leaf in sunlight and toward it in the shade. The change in direction is so rapid when produced by the shadow of fast-flitting clouds across the sun's disc that it would seem that the change of temperature could hardly be felt by the plant, it certainly could not be by an ordinary thermometer; but a heated body properly placed will quicken the circulation, as will cold retard it. If I mistake not we have here a fine demonstration of the conversion of light into heat by its passage through the vegetable tissues, and of heat into motion by its action upon the laticiferous vessels."

PROF. HUXLEY DEFINES HIS POSITION.—In a lecture recently delivered at Cambridge, Prof. Huxley used the following language: "I hold, with the Materialist, that the human body, like all living bodies, is a machine, all the operations of which will sooner or later be explained on physical principles. I believe that we shall, sooner or later, arrive at a mechanical equivalent of consciousness, just as we have arrived at a mechanical equivalent of heat. If a pound weight falling through a distance of a foot, gives rise to a definite amount of heat which may properly be said to be its equivalent, the same pound weight, falling through a foot on a man's hand, gives rise to a definite amount of feeling which might with equal propriety be said to be its equivalent in consciousness."

FIRST ISOLATION OF CHLOROFORM.—The discovery of chloroform is attributed to Soubiran, Leibig, and our American Gutrie about 1830, but Gautier shows satisfactorily that Serullas had it in his hands in 1824, six years previously, without recognizing its true nature, he having actually obtained chloroform by the action of perchloride of phosphorus on iodoform, which latter body he had then just discovered. Serullas thought the product was iodoform deprived of a portion of its iodine, and called it *protohydriodide of carbon*. Boutlerow afterwards concluded it was *iodide of methylene*; but Gautier now finds that it was nothing more or less than chloroform.—*Chemical Abstracts*.

BISULPHIDE OF CARBON IN COAL GAS.—A Vogel's new method of detecting bisulphide of carbon in coal gas, consists simply in passing the gas, after all sulphuretted hydrogen has been separated, through a glass bulb containing strips of bright copper. The latter assumes a red tint, and nitric acid boiled with it afterwards, gives a precipitate of sulphate with a barium salt. This, if reliable, is an exceedingly valuable method. It will at once be tested by us.—*Prof. Wurtz*.

PREPARATION OF PURE NITROGEN.—Berthelot recommends to agitate air in a flask furnished with a safety tube with aqua ammonia and copper turnings. He then pours in, through the tube, water which has been previously treated with ammonia and copper turnings, and drives the nitrogen through sulphuric acid to dry it and absorb ammonia, and collects it over quicksilver.—*Soc. Chimique de Paris*.

ALL PHYSICAL FORCES DUE TO GRAVITATION.—We take the following from Prof. W. A. Norton's article on "Molecular and Cosmical Physics" in *Silliman's Journal*: "In the act of formation of the existing cosmical masses by condensation, the motions of their elementary parts have been directed toward the center of gravity of the mass, and the mutual destruction of such opposing motions has developed an equivalent amount of living force in the form of heat. By the continued operation of the gravitating force in the sun and earth, and probably in innumerable other worlds, the transformation of the work of condensation effected by this force into an equivalent store of heat-work is constantly going on. The heat of chemical combination, as well as that of liquefaction and solidification, are attributable to the gravitation of the electric ether toward the atoms of ordinary matter. All the heat and attendant light evolved since the creation, form a store of accumulated work equivalent to the work done by the force of gravitation in effecting all the condensations that have hitherto taken place. This heat and light force has been in its natural operations opposed to the force of gravitation, and so essentially a separating and decomposing force. It has been the great physical agent in all the processes of vegetable and animal life. It has ever been passing through cycles of transformation into other physical forces, but in all its transformations the entire amount of energy, actual and potential, has remained invariably the same. Chemical combination, the electric current, liquefaction, and solidification, are instances of motion directly due to the general gravitating force operating on the electric ether. All motions of translation or rotation of bodies at the earth's surface are traceable directly to the same force, or to that of heat repulsion and therefore indirectly to that of gravitation."

FERMENTATION.—At a meeting of the Chemical Society, in London, June 16th, Mr. Jas. Bell read a paper on this subject. The following was one of the conclusions given as the result of a series of experiments: The addition of glucose to fermenting liquids, especially to the juice of the grape, is advantageous, inasmuch as it assists to exhaust the juice of its fermentative element, and thus imparts to the wine a greater keeping power. In the course of some remarks which followed, Prof. Williamson, the President, said that though called a "plant," the yeast organism appears rather animal than vegetable. The products of its secretion are less complicated than those it takes in; it does not require light for its vital process; and it gives off heat rather than absorbs it.

ORGANIC MATTER IN WATER.—Dr. Heisch, being informed by a lemonade manufacturer that he had suddenly found it impossible to make an article that would keep, experimented upon the water used, and found that a few grains of pure sugar would cause it to be filled in a few hours with small spherical nucleated cells. It turned out that the water had been slightly contaminated with sewage. A minute quantity of sewage water to a sugar solution, soon brought forth similar cells. Filtration through the finest paper would not remove the germs, nor would boiling for half an hour destroy their vitality. Filtration through animal charcoal, however, removed them.

DANA ON DARWIN.—Professor Dana, in his recent lecture before the Seniors, in which the subject of Darwin's theory was considered, stated that belief in a development theory was not Atheism; that the facts of science clearly indicate of some plan of development; that Darwin's book was a work of great merit and that his theory accounts for the origin of some species. As for genera and higher groups, there will probably be found other laws to account for them. Let no one fear scientific investigation. As for Atheism, give it no quarter!—*Courant*.

INSECT AID TO PLANT FERTILIZATION.—Delpino, in Italy, in a late paper notices the successive disappearance from the tropics northward of certain tribes or groups of plants with the disappearance of the tribes of insects, or of bumbling birds, etc., which effect their fertilization: Roses, Peonies, etc., disappearing with the larger Coleoptera, many Silenes and Lychnises with nocturnal Lepidoptera, until in the arctic zone there are only such flowering plants as are fertilized by the aid of Hymenoptera, Diptera, and the wind.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE.—This tunnel on the east wall of one of the lodges yesterday, having passed through ledge matter 23 feet, the whole of which promises to work from \$12 to \$15 per ton in gold and silver.

AMADOR COUNTY.

THE AMADOR.—*Ledger*, July 16th: We have the report for 1869. The receipts were \$706,080.66, and there was disbursed for mining 33,000 tons of ore, \$160,447.71; improvement of mine, \$25,835.70; milling 32,510 tons of ore, \$64,186.64; improvements and construction of Eureka mill, \$32,366.53; sundry accounts, \$36,253.53. After paying the above there remained \$384,800, which was paid to the stockholders in dividends.

CHLORINATION.—The works of Breedlove & Burr, Sutter creek, are running on sulphurates from the Keystone mine, at Amador City, paying about \$150 to the ton.

BUTTE COUNTY.

SPRING VALLEY WATER CO.—*Chico Enterprise*, 16th: Work on the canal, between Concow valley and Cherokee, is progressing rapidly. They are working 250 men, and about 1,000 feet of the pipe is on the ground. The timber for the bridge across the west branch, to hold the pipe, is on the ground. The iron work is being manufactured in Marysville. The 30-inch pipe is to be buried in the earth, and the trench for this in many places has to be blasted out.

CALAVERAS COUNTY.

SAN ANDREAS.—*Chronicle*, 16th: Placer and bill mining is conducted on a more extensive scale in that vicinity than for years. A gravel mine at the upper end of Main street is paying handsome dividends. One of the partners recently sold a share for \$1,500.

ANGELS.—By a letter we are informed that all the quartz mills in that town are in constant operation, and results favorable.

CHILI GULCH.—Shaw, proprietor of the big hydraulic, is trying to transpose Stockton ridge and Chili Gulch, and we think he will be successful.

EL DORADO COUNTY.

GEORGETOWN.—Cor. of Placerville *Democrat*, 16th: The mines are generally paying well. The Eureka keeps on, and there is talk of running nights. The Taylor mill Co. have started up to push things. As an evidence, they have let a contract for 300 cords of wood, and are negotiating for more. The claims on Georgia slide are all paying. Wood & Co., on the Parson's claim, are making money. Quite a number of claims are laid up for want of water.

INYO COUNTY.

CERRO GORDO.—*Independent*, 9th: H. A. Halt started up Belshaw & Co's smelting works on the morning of June 29th, and ran out 434 bars of bullion by the evening of July 2d, averaging over 108 bars each 24 hours.

NEW STRIKE.—We learn that W. Witherell has discovered ore in the Whits mountains, near the Hutch cañon, paying from \$200 to \$5,000 per ton.

SILVER BARS.—A Los Angeles telegram of 13th says: A train, with bullion from Owen's lake, has arrived with 532 bars of silver-bearing lead for San Francisco. It contains silver valued at about \$11,000. The smelting works are running night and day.

KERN COUNTY.

JOE WALKER MINE.—A Los Angeles telegram, dated 18th, says the mine has been purchased by Los Angeles parties, and the mill is now running.

NEVADA COUNTY.

EUREKA.—*Transcript*, 14th: This mine has been producing more gold in the last six months than ever before. From the 1st of January to the 1st of July, the yield was \$536,857, or an average of \$56,143 monthly. The sulphurates saved from several months work will add some thousands.

BLUE TENT.—But little has been done since the Fourth. The water in the ditch was closed off the day before. Work was resumed yesterday in most of the claims.

GREENHORN CREEK.—Same of 15th: W. L. Townsend, owner of the Lincoln Fluming claims, has leased the ground to a company of thirty-five Chinamen for five years, for which they paid \$2,000 down, and are to pay \$1,000 in two months. The tailings are from 20 to 40 feet deep.

DIAMOND CREEK.—G. G. Vleit, who has been running a tunnel for a year, struck

very rich gravel Tuesday. Mr. Vleit showed us a prospect from four wheelbarrow loads of gravel, which amounted to over \$20. One piece weighed half an ounce. The gold is all coarse, and sells at \$18.75 an ounce.

STAR.—Same of 16th: Stevens & Brook discovered a quartz ledge a day or two ago, near their claims on the Gold Flat road, and have taken out some rock which shows free gold.

PITTSBURG.—*Gazette*, 14th: This mine shut down Monday on account of bad air. A new shaft will be finished in four days. The mine was never looking better.

GOD'S COUNTRY.—This region, so named by the miners on account of its roughness and inaccessibility, is on the Yuba river, between Cañon and Fall creeks. It has some of the best gold ledges in the State. The Star mines are now well opened. The Lindsay will put up another 10-stamp mill. The Fidelity will have its mill running by Sept. 1st.

NORTH BLOOMFIELD CANAL.—Grass Valley *Union*, 13th: Upon this work are now engaged 350 laborers—200 Chinamen and 150 whites. When the canal is completed the company will have control of 3,000 inches of water. This, with the exception of 400 inches on the Union Co's claim at Columbia Hill, will be used in working the gravel mines at North Bloomfield.

PERRIN'S MINE.—The mill at Perrin's mine was cleaned up Monday. The result shows for 134 loads of rock crushed \$5,899.11. The profit to the owners is something over half the amount.

OMEGA.—*Transcript*, 19th: We learn that some of the hydraulic miners have commenced cleaning up. The supply of water has held out well, but is now beginning to fail.

PLACER COUNTY.

ITEMS.—*Herald*, 16th: The St. Patrick shows gold in both shaft and drifts. The more it is opened, the better the prospects. Elliott West has commenced running a tunnel to strike his quartz ledge on Rich Flat. It is believed that the same tunnel will tap a paying gravel deposit. The neighborhood was once very rich.

THE NORTH AMERICA.—*Stars and Stripes*, 14th: Jenkins & Northcutt, of this claim, in Ophir district, had 17 tons of rock crushed last week, which yielded \$10.12½ per ton. This is their third crushing. The first, of 152 tons, yielded \$10 per ton; the second, from a spot known to be poor, gave but \$3.75 per ton from thirty-five tons.

PLUMAS COUNTY.

RICH STRIKE.—Quincy *National*, July 16th: A rumor is going the rounds, in which we place considerable reliance, that a wonderful strike has been made at Hungarian Hill, near this place. Three thousand dollars is reported to have been taken out of four pans of dirt.

MINING PROJECT.—A company has been organized to tunnel through the Devil's Elbow on Spanish creek, four miles from this place, with the view of working the bed of the creek, together with the tailings that have accumulated from the washings of Badger Hill, Curtis Point, Gopher Hill and vicinity. We understand that this tunnel will give them 20 feet additional fall for getting rid of the tailings. The parties are Sacramentans.

CLERMONT HILL.—Messrs. Myers & Siley, who have been prospecting Clermont Hill for ten years, have discovered flattering indications. We also learn that another company have struck excellent prospects. This is doubtless the locality of the Blue Lead.

SAN BERNARDINO COUNTY.

Los Angeles telegram, 18th: A new silver lead has been discovered 30 miles from San Bernardino. The rock, by analysis, shows \$56 to the ton. A new mining district, embracing the late quicksilver discoveries, is organized.

SHASTA COUNTY.

QUARTZ.—*Courier*, 16th: John Shed has got down thirty feet on his ledge near the Four Mile House, and the quartz prospects rich. The ledge is a foot wide and well defined.

TRINITY COUNTY.

CLEANED UP.—*Journal*, 16th: The principal mining companies have nearly completed their work for this season. The shipments of gold dust have been about over. On Thursday of last week over \$22,000 was sent down. The season has been an encouraging one, considering the scarcity of water.

Arizona.

Mr. I. R. Ryan, recently returned from Arizona, publishes the following items: The Big Bug mill has stopped running, and the hands have all been discharged.

Failure of the ore to pay is said to be the cause.

At the Vulture mine, the lowest level was 240 feet in depth, at which the ledge did not appear to pay. Consequently the superintendent, Mr. Taylor, had discontinued work on this level, and recommenced at the surface. At the second deepest level the ore was remarkably rich.

At the Ravanna Conquest mine at La Paz, ore going over \$1,000 a ton is being taken out. Shipment of a few sacks of this ore have recently been made to San Francisco and New York.

At the Martinez district, near Date creek, an arastra was crushing some of the ore, which was remarkable rich. Mr. Robert Barton went down on the last steamer, and will probably proceed to the erection of a small stamp mill at once. These are all gold ledges.

Colorado.

ITEMS.—Central City *Register*, June 13th: The Coaley and Gilpin are yielding lean ore at present. Mr. Valentina, on the Stuh-tail lode, is down 40 feet, and has ore that pays six ounces per cord. The three Denver banks shipped in June \$127,000 in gold bullion. This represents only a small proportion of the amount produced.

GEORGETOWN.—Cor. of same: Mr. Snyder, agent of the Snyder and Trenton Co's, in June sent 10 tons of second-class ore to Hupeden & Co., that run \$200 per ton. He will ship a small lot of first-class ore to Europe the present week, having several tons on hand that will yield \$600 per ton. On the Terrible there are 27 men at work. There is 60 feet of water in the shaft. There is 100 tons mixed ore, that will yield \$100 per ton, on dump. Fourteen tons of ore sent to Swansea a short time since. The first-class ore runs \$600 per ton. The Co. raised during June 25 tons of this quality.

The Brown Co. shipped a silver button weighing 512 pounds, last week. They have a body of rich ore in their mine, in which ruby and brittle silver predominates, from which they smelt out from 600 to 1,300 ounces of silver per ton. Burlingame tunnel is in 575 feet. Baltimore has reached 475 feet. The Helmick has made the best headway of any in the county, and work continues vigorously. The Equator mine owners refuse to pay the prices demanded for labor, and have closed down the work in the mine for the present. Wages range from \$3.50 to \$4.50 per day.

ITEMS.—*Herald*, 13th: Ore from the Sovereign People (silver) lode of Grand Island district, assayed \$1,214.46 to the ton. This lode has a crevice 18 inches in width, and is owned by Mr. Pugh, of Black Hawk.

CLEAR CREEK ITEMS.—Hupeden & Co. have now a very complete establishment for the reduction of silver ores. They have two cylinders and five barrel amalgamators, and treat seven or eight tons per day. The Gentry has a vein of first-class ore, from a foot to eighteen inches wide, and rich. Select specimens assay as high as 800 ounces per ton. The lode has been stripped for several hundred feet. Stewart's saw mill is rapidly approaching completion, and it is hoped will be ready to run by the first of August. Its capacity will be twenty tons per day. It cost \$75,000.

ITEMS.—Georgetown *Miner*, 7th: The tapping of the Equator vein through the Marshall tunnel has been accomplished at last. The tunnel has been driven into Leavenworth mountain 680 feet. This morning one of the walls of the Equator was pierced, and pieces of the vein matter, identical with that mat in the shaft, were taken out. Mountain Ram lode, Dailey district, is turning out very rich ore.

Idaho.

STRIKE.—*Avalanche*, 9th: On Wednesday another quartz discovery was made in the bed of the creek, a mile up Long Gulch. We are informed that the vein is five feet in width, with a 20-inch streak of decomposed quartz in the middle. The prospects obtained by panning out the stuff shows it to be exceedingly rich in gold.

FLINT DISTRICT.—Within the last three days 475 pounds of bullion have been brought over from there. Some of the rock yielded \$200 per ton. Black's mill is running on ore from an extension of the Leviathan.

BULLION.—The bona fide bullion product of this camp for month ending July 8th, as shown by Wells, Fargo & Co's treasure shipments, is \$100,000.

COON CREEK.—A friend writes from Oro Grande, July 3d, that times had been dull on account of high water, but now more lively.

The *World* of 7th says of Loon Creek: At one place all the water is running through the flume, and last week \$1,400 feet additional was put in. In eight days nearly all the miners will be at work. Good prospects were struck eight miles below town.

SNAKE RIVER.—Cor. of *Chronicle*, July 13th: The miners are waiting until water falls. A great many will commence working on Monday; several are selling their claims from \$50 to \$500. The river is falling slowly; in about two weeks mining will commence in full blast.

Montana.

GREENHORN.—Helena *Gazette*, July 11th: About thirty men are at work and getting fair pay. A good head of water is still running, and the prospect for summer's work is good.

ST. LOUIS GULCH.—Lyster & Co. have sluiced off a wonderful amount of ground this season, and have done well. The last clean-up of two weeks' run (five hands) was \$2,000, with considerable bed-rock still to clean up. Silver creek is turning out more dust than usual. There are eighty men at work.

GOLD BRICKS.—We yesterday saw three handsome gold bricks, cast by Professor Steitz. One weighed 300 ounces and was valued at \$5,204 coin; another, 236 ounces, valued at \$4,320; and the largest, 420 ounces, valued at \$7,416.

ARGENTA.—From Maj. Boyce we learn that the T. E. Tootla furnace run out at the last cupel one hundred and sixty pounds of silver, and left four tons of lead, equal to sixty pounds of silver, uncupelled.

CANON FERRY.—The ditch from Avallancha Gulch is being finished rapidly. This will bring water to some of the safest and best mines in the Territory. The water in Hornbuckle's ditch is rather scanty; but they do some mining and take out some pay.

PILGRIM BAR.—Cor. of same, date June 26th: Holcomb & Berry cleaned up yesterday \$4,446, the result of one week's run; Smith, Hick & Co. cleaned up \$1,033.75; Steel, Ketchum & Co., \$900, and Joseph Kitchen, \$1,200, for one week's run. There are between sixteen and twenty hydraulics running on the bar. There is 2,000 inches of water in constant use, day and night, most of it is used over three or four times, and finally sold to Chinamen in Pika's Paak gulch. The bar averages in depth 10 to 15 feet. Fly & Co. are putting in a 20-inch flume. Brown & Blake have just started in on a new discovery on Granita creek. This is a bar and prospects 50 feet deep. Wilson and party are prospecting on Willow creek, three miles from Pilgrim Bar, and get two to three cents per pan.

WASHINGTON GULCH.—Cor. of same: We have but a far supply of water. The gulch yet pays from \$3 to 20 a day to the hand, when water can be had. The Delany boys are making good wages. Michael Harrison and Jack Milgrave work eighteen out of the twenty-four hours. The Kaneek brothers and Brian O'Neil have ground enough piped off now to keep ten men cleaning bed-rock for the season. The next company, Bill Reid, John Ryan, John Counners and Ned Doran, are cleaning bed-rock. Their first clean-up, four men, three days' work, was \$500; their next, four men, seven days' work, \$900. John Ferris is cleaning bed-rock with three men. His first clean-up for four days was \$700; the next six days, three men, was \$1,100. Nic. Barrens has finished piping off, and is going to commence to clean bed-rock. The Matt Grayson and James Ferris claim has created the greatest excitement yet. Mr. Ferris stated that after working with the hydraulic a few days, the water being turned off one morning, he and Pat. Williams picked up, in about ten minutes, \$1,300; one piece weighing \$106. He has now commenced cleaning bed-rock, and has picked up another piece still larger, weighing \$210.

UPPER RACE TRACK DITCH.—*New North-West*, July 8th: This is now completed six miles. The capacity is 1,700 to 2,000 inches. It is believed that when it is finished, the region will be as good as Pilgrim Bar.

GOLD DUST.—The receipts of gold dust have been largely in excess of any previous week, and from the cloostat estimate we can make will aggregate over 6,000 ozs.—nearly \$120,000—a large proportion being exchanged for currency. The stringency that has been felt here for the past year is clearing up.

CEDAR CREEK.—A tunnel penetrates hill claim No. 58 above discovery, Barratt district, and pays from \$90 to \$110 to a set of timbers, six-foot cap. No. 66 above, in the same district, has three feet of pay gravel, which averages 75 cents to the pan. The stampede out of Cedar has altered

somewhat. Prospectors from the St. Regis Borgia river have returned, reporting just gold enough not to pay. McWhirk, Warren & Co., 52 to 55 above discovery, cleaned up last week, five day's run, \$612. Two nuggets, \$39 and \$25, were the largest pieces in the clean-up. Prospect Gulch is the only paying tributary of Trout creek.

Nevada.

COPE DISTRICT.

ITEMS.—Elko Independent, 13th: Since Saturday, Wells, Fargo & Co. have received \$2,000 bullion from Cops.... This Galena mine at Lone Mountain is developing into a valuable property.... Walbridge & Presson commenced taking down their 5-stamp mill at Silver City, Idaho, on Wednesday, for the purpose of removing it to Mountain City, to crush ore from the Monitor mine.... Same of 16th: Whitney & Co. yesterday shipped to Reno from the Porter mine, Bull Run district, 141 sacks of ore, weighing 12,683 pounds.... Bullion received by Wells, Fargo & Co., from Cope, in this last three days, \$2,143.

HUMBOLDT.

PLACER MINES.—Register, 16th: We understand that a number of men are engaged in placer mining on Rehol and Willow creeks in the northern part of this county, 50 miles from Winnemucca.

ONEIDA.—Silver State, 15th: The smelting works are under full blast. The Rochester mine, in Sacramento district, has closed for a time.

BUENA VISTA.—Jack Cavanaugh has struck a body of fine looking ore near Unionville. Several new mines have had work commenced upon them within the last week. All look well as far as worked.

BATTLE MOUNTAIN.—The English Co., in Copper Cañon, have 26 men constantly at work underground, and are shipping 100 tons of copper ore, monthly, to England. The ore ranges from 30 to 90 per cent. copper.... Mr. Emerson is owner of some fine copper mines, in this same neighborhood.... The Bryer Bros. have contracted with the owners of the International, to sink a shaft 110 feet, for half their ground.... The Cherokee mine is turning out splendid mineral.... The Avalanche has just struck some of the finest Galena ore ever discovered in the district—at the depth of 40 feet, when the water rushed in in such quantities as to compel them to leave. The owners have leased the mine for one year to Mr. Waddleigh from San Francisco; he paying \$20 per ton for all the ore taken from the dump, and guaranteeing to sink the shaft 125 feet.

WASHOE.

CHOLLAR POTOSI.—Gold Hill News, 16th: Daily yield 230 tons, assays averaging \$60. The ore-producing sections are showing improvement, both in quantity and quality. The Annual Report, just published, gives the profit at \$420,000. The cost of working has been reduced, and the yield increased.

OVERMAN.—Annual Report shows total receipts \$531,000, and expense \$517,000. Receipts for June, \$18,700.

YELLOW JACKET.—Daily yield 350 tons, of which 200 is from the upper levels, and the balance from the rich section between the 800 and 900-foot levels. The prospects for developing new and valuable bodies of ore shortly are good.

HALE & NORCROSS.—Daily yield, 250 tons, principally from the 7th or lowest level. Work has been carried north to the Savage line, in good ore all the way except the last 30 feet.

SAVAGE.—There appears to be little prospect for finding any new and good bodies of ore except near the Hale & Norcross line at the lowest levels.

IMPERIAL-EMPIRE.—The shaft is now 1,230 feet deep, and sinking progresses slowly, owing to the hardness of the rock and trouble from water. The winze connection gives excellent circulation of air.

OPHIR.—The southwest drift, No. 2, has cut into promising ledge matter, but the rock being hard, it was thought advisable to hack out and drift south.

WHITE PINE.

REVIEW.—The News of 17th gives figures to show the importance to the mining interest of separating works on the ground. It reports "increased activity in the principal free metal ledges on the Hill, and an enhanced feeling of improved times among the miners themselves."

ITEMS.—The Original Hidden Treasure has a larger force than for some time, in order to fulfil previous contracts to furnish rock for mills.... The Silver Wedge and Silver Wave—or the Hidden Treasure Extension, as they are now consolidated—are taking out ore of fair quality.... The Philadelphia Co. is working the Wabash and Hemlock; and the Anchor Consolidated is running into encouraging ore.... In the

Base Metal Range the Trench mine looks fine. The Maggie Consolidated Tunnel, on the eastern slope of White Pine Mountain, is nearly into the body of ore sunk upon from the Golconda shaft. The mines west of Sawmill Cañon are progressing, and good ore continues to be sent to the smelting works. The Jennie A Consolidated is lively.... In Blue Hill work goes on.... Two mines have been opened with encouraging prospects, on the Illapah side of Momomoke Mountain. In one a shaft has been sunk 25 feet, and assays have run as high as \$60.

SMELTING WORKS.—The Eagle furnace at Swansea is doing splendidly on ores from a variety of mines. A run of 18½ tons yielded \$242 per ton in silver, exclusive of the lead. The White Pine Works, have met with a legal obstruction raised by a part of the company itself. The Weiland runs right along, and when we last heard from this Rathburn, it was in full blast. The Alsop will fire up shortly.

BULLION.—The amount of fine bullion forwarded by Wells, Fargo & Co. during the week was \$32,773.22—\$20,783.08 to the East, and \$11,990.14 to the West. Of this \$6,452.55 came from Reville.

OUTSIDE DISTRICTS.—Some 5,100 ounces amalgam from Reville, the product of the first run of six days, made by the New York Co., which recently purchased the property, yielded, at Van Wyck's in Hamilton, five bars, worth \$6,452. The ore was chiefly from the Spy mine.... Jos. Williams, on a newly discovered 6-foot ledge in Reville, sunk sight feet through \$100-ore all the way.... Everything is lovely at Pinto, and the prospects never were more flattering. A number of mines have recently changed hands. The Nevada Land & Mining Co., of English capitalists, is opening the Champion mine, which is believed to be as good as the Maryland. The latter is shipping ore regularly. Governor Bladell has purchased the water power of Piute creek, and intends to erect furnaces and a mill.... The negotiations to consolidate a large amount of mining property and the Buel Furnace into one company at Eureka have been finally accomplished. The consideration was \$100,000. The Eureka Consolidated Co. is now composed of D. E. Buel, I. Bateman, Wm. M. Lent, George Heart, Wm. Thompson, Gen. G. S. Dodge and Major Conley.

Telegram. Hamilton, July 18th: Ex-Governor Mattison, of Illinois, broke ground this morning for large smelting operations in base ores.

New Mexico.

THE NEW MINES.—Cor. of Santa Fé Post, July 9th: The miners' meeting, on June 11th, threw open to re-location all the paper claims, and a number have been taken up.

ELIZABETHTOWN.—Cor. of same: There is now 250 inches of water in the big ditch. The branch ditch will be finished Saturday, then several claims in Little Negro and Michigan Gulches will go to work. The machinery and cars for the tramway for the Chester lode arrived a day or two ago.

The Press and Telegraph gives part of a letter dated Rio Membras, June 11th: "I have been to a new district, Silver Flat, 10 miles southwest of Pinos Altos. I am here for an outfit, and shall start back here to-morrow. I saw over an ounce of silver taken from four ounces of rock. The extent of the ore is immense. Nothing doing at Ralston."

Mr. Lynch informs the Press and Telegraph that "the California company that own immense interests in that region, have, as yet, expended but little in the development of their mines, and have no machinery on the grounds."

The rolling stock of the Chester proves too heavy, and therefore useless. About 200 feet of the wire rope was apolied by the careless Mexican drivers.

Utah.

BRIGHAM CANON.—Salt Lake Tribune, July 16th: The richest leads so far are in Ophir Hill, on the north side of the creek. The ore is argentiferous galena, and has assayed from 22 to 150 ounces silver and from 30 to 75 per cent. lead to the ton. J. W. Cooley and Harrison Severe, of Grantsville, have a lead which they said had assayed as high as \$1,500 in silver to the ton; but the piece was probably a choice specimen. The Lincoln, ore at a depth of 25 feet, assayed 73 per cent. lead and \$90 silver to the ton. The croppings of the Fairview gave over 60 per cent. lead and 31 ounces silver to the ton, with a ledge 14 feet wide. In Dry cañon, three miles to the north, very rich discoveries have been made. Work is being pushed forward with vigor. The great drawback is the lack of water.

The Grain Market.

The wheat now being harvested will be somewhat less in quantity, but better in quality, than the year preceding. The increase in prices, however, will probably more than make up for loss in quantity. Now that the war in Europe is a settled fact, the grain market must keep up, and if it lasts any considerable length of time, high figures will be reached, and very high figures if other nations than France and Germany become involved.

The opening prices of wheat this present year in this city was \$1.70@\$.1.90 per cental, against \$1.60@\$.1.80 at the opening of the previous year. Freight to Liverpool are a trifle lower than last year.

The excitments of the Liverpool, New York and Chicago markets, growing out of the French government purchases, some five or six weeks since, met with a prompt response in San Francisco. The advance at that time in Liverpool was from 10s. on the 21 of June, to 10s. 6d. on the 11th, at which figure it remained until the 16th, when a further advance to 10s 11d. was reached on the 21st. From that time to July 10th there was a gradual decline to 10s. 31., when the European complications being such as to render war imminent, wheat again commenced to advance, reaching 11s. on Saturday last, the day after war was declared. Since that date the advances has been as follows: Monday, the 18th, 12s.; Tuesday, 12s.; Wednesday, 12s. 3d.; Thursday, the latest date previous to our going to press, 12s.

In this State farmers and other holders have become so much slated by the above advances as to be utterly unfit or disinclined for business. Not being disposed to sell on a rising market, transactions for the past week have been confined to small lots, for local milling, for which from \$1.95 to \$2 is being paid for new, and \$2 @\$.2.10 for old. Shippers say that they are paying only \$1.85@\$.1.90, asserting that English orders are no better than before the excitement commenced. No large purchases will probably be made until the war status is well understood. The wheat now loading is from purchases made before the advance.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

ORE FORWARD.—Four big teams, loaded with Leviathan ore, passed our windows to-day, outward bound. This is a trial lot of ten tons or so sent out to a quartz mill in Dayton to be used in working Comstock ores, in lieu of sulphate of copper, now used.—Alpine Miner.

San Francisco Mining Stock Market.

During the week under review the bulk of the sales were confined to Savage, Yellow Jacket, and Original Hidden Treasure, while the general list exhibits a recession from the opening rates of the week. There is not as much vitality apparent during the last month and more as a legitimate dealer would desire, and for the alleged reason that mines are not now managed in the interest of shareholders, but in the interest of mill-owners. As will be seen by the bullion tables published herewith, the receipts are quite fair; but when we look at the heavy assessments levied by the various companies it cannot be concealed that the combined expenses, in most instances, far exceed the receipts, and with most of the Comstock mines in this condition we cannot expect to have a very healthy market. In some instances ore are reduced that actually do not cover the expenses of milling alone. A few mines, it is true, are paying dividends, and the prospects of several others are very fair; nevertheless, the depression is very general.

CHOLLAR POTOSI—has been well maintained during the week under review, sales being fully as large as the previous week. During the six days ending July 15th, 1,730 tons of ore were extracted, against 1,370 tons the previous week. The sample assay value is \$62.36, against \$64.20 per ton. The various faces throughout the mine from which ore is being extracted, have fully maintained their previous good appearance, while the number of tons extracted has been materially increased. The Belvidere section, at the south end of the 18th and track floors, shows considerable improvement in quantity of ore, and the quality remains about the same. At the new shaft, the south drift from the top of the mine has improved, and is said to look favorable for finding good ore soon. On the 19th inst., \$54,306 in bullion was sent forward to the office in this city.

HALE AND NORCROSS—sold to a moderate extent, at a lessened price. During the week ending July 16th, they extracted as follows: from 175 level, 313½ tons; 300 level, 150; 535 level, 68½; and from the 7th station level, 1,097½ tons, making 1,633½ tons, against 468 tons the previous week. They have on hand in the dumps 4,023½ tons. The winze below the seventh level is now down 50 feet, and the quality of the ore is reported to be good. As yet they are but little troubled by the water. The ore breasts on this lower level look favorable at present.

IMPERIAL—obtained a uniform price during the past week, On the 19th inst. they experienced a little change in the bottom of the shaft, and has at least given them better ground for sinking. The Superintendent reports a vein making in on the east side, which seems to be pitching west about 45 degrees. No change to note in the cross-cut. They started another cut east, and will soon start a cut about fifty feet up the winze.

YELLOW JACKET—has been taking quite a sharp downward turn in the open market. By telegraph from Virginia City the following figures are obtained from the Superintendent's annual report: Product of the mine, \$1,779,227; receipts from assessments, \$528,000—total receipts, \$2,307,227. Indebtedness, July 1, 1869, \$305,605; expenditure during the year, \$1,722,725; balance on hand July 1, 1870, \$278,897, as follows: On deposit, \$119,609; due on railroad account, \$129,056; supplies on hand and paid for, \$30,232—\$278,897, and to balance debit side adds up \$2,307,227.

KENTUCK—has been dull of sale. For the week ending July 16th, 146 tons of ore were extracted, showing an assay value of \$1,637.10, equal to \$11.21 per ton. On the 80-level quite an improvement is said to be visible. A stratum of ore about four feet wide has been cut, which promises to yield say \$20 to the ton, and may reach to the surface. Quite a large amount of ore is known to exist on and above the 600-level, and a large number of workmen have been unsuccessfully attempting to reach the ore. A raise is now being made from the track floor of the 700-level to connect with the drift from the Kentuck shaft on the 600-level of the burning section, and if this can be done, they expect to get at the smouldering timbers, and so reach the ore bodies.

CROWN POINT—sold to a larger extent than last week, but at a lessened figure. During the week ending July 15th, 351½ tons of ore were extracted, valued at \$4,595.47, or \$13.07 per ton. On the 16th inst. the incline was 146 feet in depth below the 1,000 level, and the quartz encountered is very hard, but is said to show signs of improvement. The prospecting in the old "wet workings" has not yet developed any new bodies. The water in the 1,100 level "makes" so fast that the pump has to be kept constantly at work. On the 18th sent forward \$6,431.54 in bullion.

SIERRA NEVADA—was in the market to a considerable extent at slightly improved rates. For the run ending July 15th, 400 tons of ore were taken from the ledge and 390½ from the gravel deposits. On the 18th bullion to the extent of \$9,000 was sent to the office in this city. OCCIDENTAL levied an assessment of \$5 per share on the 15th inst. GOULD & CURRY rapidly declined during the week, but at the close had more than regained the decline, under very considerable sales. For the week ending July 18th they extracted 236 tons of ore, showing an average assay value of \$32.60 per ton. No favorable developments have been made during the past week in any portion of the mine. An assessment of \$12.50 per share was levied on the 14th inst.

DURING a heavy rain-storm on the 12th inst., a freshet damaged farms and crops to a great extent in the vicinity of St. George in Utah.

THE Vallejo City water-works, to cost \$250,000, will, after next December, supply 3,000,000 gallons daily.

THE artesian well for the water works at Stockton has been completed. It is 136 feet deep.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

THE CABBAGE FLEA, whose ravages upon the cabbage plants in Nevada and other localities was noticed last week in the first column under our agricultural head, is doing much damage the present season in the vicinity of New York. In past years its depredations have been chiefly confined to the young plant, when just coming leaf; but this year it has attacked full grown plants, so as to either destroy them in great numbers, or seriously affect their growth. Instances are noticed where they have even attacked old stumps set out for seed; eating off the leaves so fast as they were developed, and thus preventing the production of seed.

The remedies applied are those usually employed to destroy plant lice, such as strong tobacco water, a solution of soft soap, etc. Lime and dry earth applied as described on page 42 of our last issue would no doubt be quite efficacious.

ORANGES FROM LOS ANGELES.—The cultivation of oranges in Los Angeles is rapidly increasing. In 1868 there were 724,450 oranges and 91,500 lemons shipped to this city. In 1869 the orange crop fell off to 334,200, but the shipment of lemons increased to 111,000. Thus far this year 2,540,000 oranges and 181,000 lemons have been received here, and at least one more considerable shipment is expected.

Our importations of fruit from Tahiti during the first six months of the present year have been 3,302,000 oranges, 265,000 limes and 53,250 coconuts. At the present rate of increase in Los Angeles we may expect that importations of oranges from abroad will very near or quite cease in a year or two, while the competition among home producers will materially decrease the present price of this fruit.

CULTIVATING THE POPPY.—The Lower Lake *Bulletin* says that a Frenchman in Lake county, Mr. Guillardon, has thirteen acres of land planted with the poppy, which now presents a beautiful appearance, with its red and white flowers, in fullest bloom. We presume Mr. G. cultivates for the opium as well as for the oil, which is extracted from the seed; although the *Bulletin* makes particular mention of the latter, while no reference is made to the former and most important product. A most excellent salad oil is extracted from the poppy seed. This experiment in the cultivation of the poppy, on so large a scale, is a very important one, and we shall endeavor to report the result of the same for the benefit of our readers.

CORN ROOTS SIX FEET DEEP.—A gentleman stated at a late meeting of the Farmer's Club of the American Institute, in New York, that a friend of his in digging a well recently traced corn roots to a depth of six feet. Of course deep plowing and a dry season did it. Corn is not naturally a deep-rooted plant; but when it is threatened with drouth if the farmer will only help it a little through or into the hard pan, it will make wonderful efforts to find moisture.

PERUVIAN BARK IN INDIA.—The English are cultivating in India the plant which produces the famous "Peruvian bark." There is an area of 965 acres at one locality, on which over 3,000,000 plants are growing. The plant grows to a height of 15 to 20 feet. Might not this plant be successfully cultivated in the southern portion of California?

THE CATTLE DISEASE.—Mr. Bookstaver, the City Market Inspector, publishes a card in which he says he can find no ground for the statement of Mr. Imbourg, that a disease exists among the cattle which are now furnishing meat for this city.

Broadcast Sowing.

We have already, in past numbers, endeavored to show the importance of a thorough mechanical preparation of the soil for the reception of grain seed. This is all the more necessary when dependence for support of the plant is sought for from the natural fertilizing elements in the soil, rather than from the addition thereto of artificial or extraneous fertilizers.

Experience in this and in every other region has abundantly proven that lands well and deeply pulverized (when deep plowing is at all applicable) withstand drouths much better than when they are subjected to imperfect preparation or shallow tillage. In fact, a favorable season does but little more in producing a good crop than does thorough mechanical culti-

FIG. 1—IRREGULARLY-PLOWED FURROW SLICES.

vation in an ordinary one. But our object in the present article is more particularly to show

How the Seed Should be Placed in the Soil.

We have heretofore shown the results of placing it in soil too wet and too dry; we have also alluded to the advantages and disadvantages of deep and shallow sowing. No general rule universally applicable can be given for the depth at which seed should be placed in the ground. Grain seeds in a moist, heavy soil usually germinate most surely when sown at a depth of not exceeding one to three inches; but in light porous soils, they will do better at a greater depth, say from three to five inches, or even more.

Prof. Newberry says that the Moqui Indians who cultivate the table lands of the higher Colorado are obliged to deposit

FIG. 2—IRREGULAR DEPOSITION OF SEEDS.

the seed of corn from twelve to fourteen inches below the surface. Corn or wheat planted in that soil and climate, at the depth usually employed here and in the Western States, would never germinate, for the reason that the country is almost without rain, while but very little dew falls. It is at a depth of a foot or more that moisture sufficient for germination can there be found. Hence, in sowing or planting, reference must be had not only to the character of the soil, but also to the kind of weather which is expected during the period of germination.

Seed Should be Sown at Regular Depths

Whatever depth may be decided upon for sowing, it should be uniform throughout the field, or at least on such portions of the field as are uniform in soil and moisture. The disadvantages arising from sowing at irregular depth are strikingly and faithfully shown by the figures 2 and

FIG. 3—IRREGULAR GROWTH FROM IRREGULAR SOWING.

3, herewith given; while a not uncommon cause of irregular depths of sowing may be understood by an examination of Fig. 1, with the accompanying explanation.

Fig. 1 shows a section of an irregular, ill-plowed field. It is evident that grain sowed upon a field so plowed cannot be evenly covered or spread. In some places the seed will work down into the air spaces below the furrow; while in other places, as

b, in Fig. 1, it will be barely covered. Harrowing the land previous to sowing, as is usually done, cannot fully remedy the defects of bad plowing; for even if the surface is made even, it is impossible to properly cover, with merely the action of the harrow; and the after assistance of a roller or surface mould will still leave the work imperfect. Smooth the ground, as evenly as possible, still much of the seed, after harrowing, will be left upon or near the surface, while more or less will slide into the ruts after the tines of the harrow, and be buried at twice or thrice the depth of that which has the least covering.

Fig. 2 shows the positions which the seed will assume after such covering; while Figs. 3 exhibits the growth consequent upon the same.

We have already, in previous numbers, shown the disadvantage of uneven growth in a field of grain. If a portion of ground, as at a, in Figs. 2 and 3, is planted shallow, and the season and soil is such as to allow of such shallow depth giving a vigorous plant, those plants will completely overshadow and greatly retard the growth of the deeper covered seeds, as at b, in the same figures. The consequence will be that the less vigorous plants will merely cumber the ground, taking away, so long as they grow, nourishment from a, and come to nothing in the end—as they will either produce a small, shriveled, imperfect grain, which will be rejected by the separator, or the plant will cease growing before the seed is formed. Every cultivator knows that if his crop does not mature alike, the grain cannot be alike in the sample. Hence the importance of good plowing and uniform covering. We shall continue this subject next week, with further illustrations.

ORCHARDS AND POULTRY.—An experienced orchardist says: "The public has yet to learn the full advantage of keeping poultry. Few seem to appreciate what they may do among trees in an orchard of a quarter of an acre, where they may be kept by a picket fence four or five feet high, putting in about one hundred and twenty five fowls, and observe the result. He will avoid the annoyance in the garden, of which so many complain, while they will work among the trees, doing just what is needed; keeping the ground well cultivated and destroying everything that can injure the fruit trees in shape of bugs, worms or other insects, lay a large number of eggs, which are a cash article, to say nothing of the chickens, which will pay for raising at the present time. I have tried it, and know it to be so."

Some valuable hints on orchards will be found in Mr. Greelsy's No. 27 on "What I Know of Farming," which will be found in another column of our present issue.

TO REMOVE MOTES AND CHAFF FROM THE EYE.—M. Tinkham, St. Louis, Kansas.—Calomel is one of the very best remedies for motes or chaff in the eye of horses or cattle. I had a cow that got an oat chaff on her eye-ball which resisted all efforts at removal. Her eye became so swollen she could not open it, and a white film had begun to grow upon the ball. I was speaking to one of my neighbors about it; he recommended the above remedy, which I applied, blowing it into the eye with a goose-quill, about the bulk of a grain of wheat. Twenty-four hours after, no one would have supposed anything had ever ailed the eye. I know of other instances where it has been used with equal success.—*Exchange.*

BAULKY HORSES.—A Maine man gives his method of treating baulky horses as follows: "Let me inform humane men and hostlers, and all who hold the rein, that the way to cure baulky horses is to take them from the carriage and whirl them rapidly around till they are giddy. It requires two men to accomplish this—one at the horse's tail. Don't let him step out. Hold him to the smallest possible circle. One dose will often cure, but two are final with the worst horse that ever refused to stir."

POTATOES.—Mr. Hexamer has growing upon his farm near New York more than 200 varieties of potatoes.

Our Late Horticultural Visitors.

Our late horticultural visitors from the East, who left Wednesday morning on the train, homeward bound, have expressed themselves much pleased with their visit. They have avoided all ovations, but have constantly received the favors of friends. Of this party, Mr. Charles Downing, brother of the late lamented A. J. Downing, is now well known as the author of a revised edition of his brother's work, entitled "Fruit and Fruit Trees of America," a new edition of which has just been published. This is a magnificent book of 1,100 pages, and, in the words of Marshall P. Wilder, "constitutes an encyclopedia of American pomology." He was a partner in the nursery with his brother when the latter wrote this first book. Mr. Downing is sixty years of age, and has devoted a lifetime of study and labor to this noble work. Two of the other gentlemen, Messrs. Ellwanger and Barry, of Rochester, N. Y., have the largest nurseries in the world. While the largest one in Europe is 400 acres, this covers 600 acres, and constantly employs 200 men. Mr. Barry succeeded A. J. Downing as editor of *The Horticulturist*. He is chairman of the General Fruit Committee of the American Pomological Society. He is also author of a book—"The Fruit Garden."

It was my good fortune to meet this party of gentlemen, and to enjoy

An Interview with President Wilder.

It is a pleasure to fall in company with a worthy gentleman who has earned a reputation and a fame by energetic devotion to a good cause; and it was a real pleasure to me to spend a half hour in earnest conversation with the pioneer President of the American Pomological Society, the Hon. Marshall P. Wilder. Although venerable with the imprint of years, his face beamed with the frank enthusiasm of youth when he spoke of the wonders he had seen in his journeyings among the farms and orchards in this State; the prodigious growth of vegetation, almost tropical in its luxuriance, on moist river bottoms and irrigated tracts; the effect of soil and climate, of mountain and valley, of sea breezes and interior drying winds; the immense grain fields upon the plains of our vast valleys; the grand mountains with their forests of evergreens; the plants that are so delicate in the green-houses of the East here lavishing a profusion of foliage and flowers in the open gardens, and the elegant ornamental trees—natives of far-off southern climes—flourishing under our bright skies; and not the least interesting of all, the fruit trees and the fruits of California!

Mr. Wilder had expected to find a grand and generous country; but the vague conception of it which he had formed from his surroundings in the East were so completely bewildered by the startling reality that he admitted he was surprised and delighted continually. The half had not been told, and imagination must yield the palm to reality.

He considers this country incomparable. The rapid growth and early and prolific bearing of the trees are remarkable, while the fruit is free from injurious insects, and is greatly superior in size and beauty to that of the East.

A Second Visit Promised.

I called his attention to the desire of the Oregonians, as expressed through the journals of that State, to secure a visit from the party, and inquired if he designed visiting Oregon. He regretted that he could not this season; but he expects to revisit this coast another year, when he hopes to be able to travel more extensively and include that State. This, I know, will be received as good news by our culturists, for we needed to be better understood by our Eastern friends; and more than that, we need the instruction and the system which such influence can best bring to us. While our visitors appreciate our natural advantages, we must not suppose them blind to defects and careless ways, nor to the many grinding evils that greed and speculation have brought upon us.

S. H. HERRING.

FLAX IN OREGON.—The Willamette Farmer says that a large warehouse is being fitted up in Salem to receive the incoming flax crop of Linn county.

What I Know of Farming—No. 27.

Peaches—Pears—Cherries—Grapes.

Our harsh, capricious climate north of the latitudes of Philadelphia, Cincinnati and St. Louis—so much severer than that of corresponding latitudes in Europe—is unfavorable, or at least very trying, to all the more delicate and luscious fruits, berries excepted. Except on our Pacific coast, of which the winter temperature is at least ten degrees milder than that of the Atlantic, the finer peaches and grapes are grown with difficulty north of the fortieth degree of latitude, save in a few specially favored localities, whereof the southern shore of Lake Erie is most noted, though part of that of Lake Ontario and of the west coast of Lake Michigan are likewise well adapted to the peach.

It is not the mere fact that the mercury in Fahrenheit's thermometer sometimes ranges below zero, and the earth is deeply frozen, but the suddenness with which such rigor succeeds and is succeeded by a temperature above the freezing point, that proves so inhospitable to the most valued tree fruits. And, as the dense forests which formerly clothed the Alleghanies and the Atlantic slope, are year by year swept away, the severity of our "cold snaps" and the celerity with which they appear and disappear are constantly aggravated. A change of 60°, or from 50 above to 10 below zero, between morning and the following midnight, soon followed by an equally rapid return to an average November temperature, often proves fatal even to hardy forest-trees. I have had the red cedar in my woods killed by scores during an open, capricious winter; and my observation indicates the warmest spots in a forest as those where trees are most likely to be thus destroyed. After an Arctic night, in which they are frozen solid, a bright sun sends its rays into the warmest nooks, whence the wind is excluded, and wholly or partially thaws out the smaller trees, which are suddenly frozen solid again so soon as the sunshine is withdrawn; and this partly explains to my mind the fact that peach-buds are often killed in lower and level portions of an orchard, while they retain their vitality on the hill side and at its crest not 80 rods distant from those destroyed. The fact that the colder air descends into and remains in the valleys of a rolling district contributes also to the correct explanation of a phenomenon which has puzzled some observers.

Unless in a favored locality, it seems to me inadvisable for a farmer who expects to thrive mainly by the production of grain and cattle, to attempt the growing of the finer fruits, except for the use of his own family. In a majority of cases, a multiplicity of cares and labors precludes his giving to his peaches and grapes, his plums and quinces, the seasonable and persistent attention which they absolutely require. Quite commonly, a farmer visits a grand nursery, sees with admiration its trees and vines loaded with the most luscious fruits, and rashly infers that he has only to buy a good stock of like trees and vines to insure himself an abundance of delicious fruits. So he buys and sets, but with no such preparation of the soil, and no such care to keep it mellow and free from weeds, or to baffle and destroy predatory insects, as the nurseryman employs. Hence the utter disappointments of his hopes; borers, slugs, caterpillars, and every known or unknown species of insect enemies, prey upon his neglected favorites. At intervals, some domestic animal or animals get among them, and break a dozen down in an hour. So, the far greater number come to grief, without having had one fair chance to show what they could do, and the farmer jumps to the conclusion, that the nurseryman was a swindler, and the trees he sells scarcely related to those whose abundant and excellent fruits tempted him to buy. I counsel every farmer to consider thoughtfully the treatment absolutely required for the production of the finer fruits before he allows a nurseryman to make a bill against him, and not expect to grow Dutchess pears as easily as blackberries, or Ionas and Catawbas as readily as he does fox-grapes or the wilows which overhang his brook; for if he does he will surely be disappointed.

Some of our hardier and coarser grapes—the Concord preëminent among them—are grown with considerable facility over a wide extent of our country; and many farmers, having planted them in congenial soil, and tended them well throughout their infancy, are rewarded by a bounteous product of two or three years. Believing their success assured, they imagine that their vines may henceforth be neglected, and in the course of two or three more

years they are often utterly ruined. I know that there are wild grapes of some value, in the absence of better, which thrive and bear without attention; but I do not believe that any grape which will sell in a market where good fruit was ever seen can be grown north of Philadelphia but by constant care and labor, or at cost of less than five cents per pound, under the most judicious and skillful treatment. In California, and I presume in most of our States south of the Potomac and Ohio, choice grapes may be grown more abundantly and more cheaply. Yet I think the localities are few and far between in which a ton of good grapes can be grown as cheaply as a ton of wheat, under the most judicious cultivation in either case.

I do not mean to discourage grape-growing; on the contrary, I would have every farmer, even so far north as Vermont or Wisconsin, experiment cautiously with a dozen of the most promising varieties, including always the more hardy, in the hope of finding one or more adapted to his soil, and capable of enduring his climate. Even in France, the land of the vine, one farm will produce a grape which the very next will not; no man can satisfactorily say why. The farmer, who has tried half a dozen grapes, and failed with all, should not be deterred from further experiments; for the very next may prove a success. I would only say be moderate in your expectations and careful in your experiments; and never risk even \$100 on a vineyard, till you have ascertained, at a cost of \$5 or under, whether the species you are testing will thrive and bear on your soil.

In my own case, my upland mainly sloping to the west, with a hill rising directly south of it, I have had no luck with grapes, and I have wasted little time or means upon them. I have done enough to show that they can be grown, even in such a locality, but not to profit or satisfaction.

I would advise the farmer who proposes to grow pears, peaches, and quinces for home use only or mainly, to select a piece of dry, gravelly or sandy loam, underdrain it thoroughly, plow or trench it very deeply, and fertilize it generously, in good part with ashes and with leaf mold from his woods. Locate the pig-pen on one side of it, fence it strongly, and let the pigs have the run of it for a good portion of each year. In this plat or yard, plant half a dozen cherry and as many pear trees of choice varieties, the Bartlett foremost among them; keep clear of all dwarfs, and let your choicest trees have a chance to run under the pig-pen if they will. Plant here also, if your climate does not forbid, a dozen well-chosen peach trees, and two each year thereafter to replace those that will soon be dying; and give half a dozen quinces moist and rich locations by the side of your fences; surrounding each tree with stakes or pickets that will preclude too great familiarity on the part of the swine, and will not prevent a sharp scrutiny of borers in their season. Do not forget that a fruit-tree is like a cow tied to an immovable stake, from which you cannot continue to draw a pail of milk per day unless you carry her a liberal supply of food; and every fall, cart in half a dozen loads of muck from some convenient swamp or pond for your pigs to turn over. Should they leave any weeds, cut them with a scythe as often as they seem to need it; never allowing one to ripen seed. There may be easier and surer ways to obtain choice fruits, but this one commends itself to my judgment as not surpassed by any other.—*Horace Greeley.*

A NEW USE FOR WHISKY.—A Scotch correspondent of the *London Farmer's Chronicle* finds a use for whisky at once novel, interesting, and original. His apple and cherry trees had been greatly injured by blight, and every experiment to arrest the disease was unsuccessful. Finally he concluded to dose his trees with whisky. This he did in June 1869. The effect has been magical. No blight has since appeared. He also rid his plum trees of insects by the use of whisky; and he found it effectual in curing his dogs of mange. We believe it would cure sheep of the ecab. Great is whisky when used for proper purposes.

AN IMPROVEMENT IN HORSE COLLARS.—J. Trumbull Smith, a harness dealer in New York, has brought out a collar that is remarkable. It is made of linen pressed in as hard as horn and fully as tough—will outlast three or four leather collars, and he has found it to gall and blister less than a soft collar. It costs less and is made to order to fit a horse after measurement.

A Day Among the Nurseries at Oakland.

Oakland has a reputation for producing fine trees and plants, and a visit to the different nurseries is well repaid.

It would puzzle a professor to name any sort of superior fruit, or ornamental tree, or any vine, shrub, rose or flowering plant, that cannot be found in some one of the several Oakland nurseries; and whoever rambles about the town and observes the shaded streets and the elegant gardens and yards, filled with a rich profusion of various choice trees and plants, must admit that the nurseries do not lack for home patronage. Leaving the railroad depot at the corner of Seventh and Broadway, a short ride in the street cars will take you to the nearest one—

F. A. Hering's Nursery.

This place has been started within two years and is mainly devoted to the culture of greenhouse plants and ornamental trees of choice varieties, shrubbery, etc. The proprietor has imported a great variety of the finest sorts of plants from Germany, and aims to excel in producing the nicest and best of everything. It is interesting to follow him through the houses and grounds and observe the wonderful effects of careful training and culture. Mr. H. takes a pride in his business, and his plants are his pets. A few blocks further along on Telegraph avenue bring us to

W. F. Kelsey's Nurseries.

Established since 1852. The grounds first occupied have been laid out in streets, and divided into house lots, and much of it covered with fine residences. He has, however, reserved a few acres, laid out a nice park and built up some greenhouses here. These are in charge of Mr. Gustafson, a superior gardener, who has succeeded in obtaining and producing an extensive collection of plants, that will compare favorably with any other establishment. I may make especial mention of his assortment of Australian trees and plants that are adapted to California and are becoming favorites here. Mr. Kelsey's main nurseries, covering some twenty acres, are out near the Deaf and Dumb Asylum. There he has a very large and excellent assortment of fruit trees, in variety, also of deciduous ornamental trees. This is the principal fruit nursery in the place. Mr. Kelsey has issued a descriptive circular of fifty pages, which enumerates the principal varieties cultivated by him. This he will mail, postpaid, to any party who will inclose in a letter of application 20 cents. The work contains much valuable information in connection with the remarks. Nearly opposite to Mr. Kelsey's is

Hutchinson's Nursery.

This occupies three acres, and is devoted to the cultivation of ornamental trees and plants. Mr. H. has been established here three years. He has a large and fine lot of California evergreens. His greenhouses are well stocked with salable plants, and in his grounds he can show what wondrous three year growth can do for standard trees and plants in California. Mr. H. has a salesroom not far from the depot in Oakland, near Hutchinson's.

Mr. King's Nursery.

This is a new place, started this year. Greenhouse plants and evergreen trees and fancy shrubbery are the principal things started here. Mr. K. is carrying on only what business he can personally attend to, and his young place is interesting, mainly, in showing the progress that one man may make with little expense in so short a time. His fine showing is a success and quite creditable to him. I next visited

Noland's Botanical Gardens.

This well known place, so liberally laid out and supplied with standard specimens of so many kinds of trees and plants, is not only a beautiful resort, but it is a study as well. Evergreen and deciduous trees in variety from all parts of the world, apparently at home in the soil and climate of California, growing side by side with the luxuriance of nature; and then the shrubbery and vines and plants so numerous and fine. Mr. Noland's place occupies five acres.

He has several greenhouses, which he is using as propagating houses. He has a fine lot of bulbous and flowering plants;

but his speciality is evergreens. These he can furnish in great variety.

Close up to the hills near the new residence (now building) of J. Ross Browne is

Pryall's Nursery.

Mr. Pryall has quite a variety for a small place. His collection of roses is very fine. He has a lot of orange and lemon trees started, and thinks that the cultivation of these fruits will yet be a success in this section of country. He showed a fine lot of tea plants, the first that I have seen in this part of the State. These he values highly. Mr. Pryall is devoting much attention to hybridizing. He has produced some elegant roses in his experiments. His experiments with the potato is a triumph, and he is now devoting much attention to the cultivation and production of new varieties of this useful vegetable. He has already produced a sort superior to all others, and he believes it possible to bring this tuber to a degree of perfection not now dreamed of by others.

Mr. Pryall has written several interesting articles on the cultivation of the potato, as also other matters relating to this business—some of which have appeared in the columns of the *PRESS*. Anything like a detailed description of the nurseries of Oakland would fill a volume. To mention the names of ranches, etc., would be writing a long catalogue. My observations here are necessarily restricted to a few general remarks. The nurseries of Oakland are a credit to that beautiful town. The oaks that were the former glory of the place, are fast yielding to the inexorable necessities of encroaching business. Only such as are accidentally in line with sidewalks are being spared in the busy streets. But the magnificent shade trees of American, European and Australian forests, are fast finding place along the streets, and give a rare beauty to the many magnificent grounds around elegant residences.

S. H. HERRING.

COPPER-COLORED HOGS are being extensively introduced in the Atlantic States. They originated from two sources.—a cross with the Black Berkshire and Suffolk, and with the Berkshire and Chester County Whites. From a continued careful selection of the best specimens of these crosses for breeders, a perfectly amalgamated breed has been obtained, which is distinguished by its peculiar red or copper color. They are said to be a very superior animal—fully equal to any, either of the full or mixed breeds.

JOHN ON THE FARM.—Farmers in many parts of the State are compelled to employ Chinamen in harvesting, owing to the refusal of unemployed white men to leave this city for work, even when offered a good price therefor—at least what they, themselves, would consider a good price in this city.

Notices to Correspondents.

I. H. T., Visalia, Cal.—There is no ice-machine, to our knowledge, now at work on this coast. We hope, however, to be able to chronicle the successful operation of one or more in a short time. At New Orleans the Carré machine has proved a success, after considerable trouble at the commencement, producing ice which sold at \$4 per ton. A machine making 7,500 pounds of ice in 24 hours, costs from \$10,000 to \$12,000.

H. AND H., Humboldt City, Nevada.—A Diamond Drill, of the size you give, will cost from \$5,000 to \$10,000, according to the extent of country where it is to be used, and the style of machine required.

SANTA CRUZ FARMERS CLUB.—The proceedings of this association, at their meeting on the 16th inst., were received too late for insertion to-day. They will appear next week.

AN AGRICULTURAL DELEGATION.—Another and quite a large body of excursionists are now on their way to this State from the East. The party consists of some twenty-five writers and correspondents, who will represent all the leading agricultural papers of the Atlantic States. They come with the special view of looking into our agricultural resources and witnessing for themselves the wonderful evidences of the productiveness of California soil. It is to be hoped that they will meet with a cordial welcome, and receive every attention which the object and importance of their mission demands.

The party will include, among others, a special committee of the Farmers' Club of the American Institute, consisting of Dr. J. V. C. Smith, formerly Mayor of Boston. Mr. P. T. Quinn, the noted horticulturist, and Jas. A. Whitney, Professor of Agricultural Chemistry of the Institute, and associate editor of the *American Artisan*. Mr. Whitney comes also in the capacity of a mechanical engineer, and whatever of engineering or mechanical interest may fall under his observation during the trip will in due time be laid before the readers of the *Artisan*.

PROF. MARSH, of Yale College, heads a scientific expedition, which is among the Rocky Mountains. The party will visit this State, it is said, before returning home.

Securing the Interior Trade.

Before the completion of the Pacific Railroad, San Francisco merchants could sit quietly in their arm-chairs and wait for the interior trade to come to them; when, however, direct communication by rail was opened with the East and wide-awake Chicago came into the field, it behooved San Francisco to get up and shake itself.

There has been considerable feeling in the interior on account of the apparent apathy of our city, and this has resulted favorably to Chicago to some extent. We saw this ourselves last summer when traveling about the mines, and our correspondent (W. H. M.) has also alluded to the subject. The inland merchants have thought that if San Francisco was so careless about the matter and Chicago so ready and obliging, that Chicago should have their trade. And so far they acted perfectly naturally and justly.

We are glad to believe, however, that there is to be an end to this thing. The advantages of position, etc., are all in our favor, and our merchants are about to secure those advantages. The interests of the interior and of this city are intimately connected. We believe in this statement, and the PRESS has always sought to act for the benefit of the whole coast—not for San Francisco alone.

Some short time ago, a young man, Mr. M. S. Wehh, determined on taking active steps for securing the inland business. His plan was warmly seconded by prominent merchants here, and the result is that a party has gone to the interior on mercantile business. At Salt Lake they have been well received; the general tone of the newspapers there is favorable, and we hope that they may meet with success everywhere. The Central Pacific will aid in their plans, and the result will doubtless be for the benefit of the whole coast. The names of the party have been published elsewhere, but the enterprise of the gentlemen deserves a still wider publication, and so we give them here. They are: T. C. Merrill, Esq., of R. A. Swain & Co., importers of glassware and crockery; G. Reed, Esq., of Macdonay & Co., importers of teas; M. S. Wehh, Esq., of Marsh, Pillsbury & Co., importers of hardware; Wm. Reddington, Esq., of Reddington, Hostetter & Co., importers of drugs; H. Reese, of Heynemann & Co., importers of dry goods; G. W. Arms, Esq., of Arms & Dallam, woodenware manufacturers; C. H. Kingsley, Esq., of Greenbaum Bro's, manufacturers of clothing; R. S. Knight, Esq., of Chenery, Souther & Co., importers of liquors, etc.; M. Leventritt, Esq., of Rosentock, Price & Co., manufacturers of boots and shoes; J. M. Pike, Esq., of Weil & Co., importers and manufacturers of tobacco and cigars; G. B. May, Esq., of Goodwin & Co., manufacturers of furniture; J. H. Ham, Esq., of G. W. Clark & Co., importers of paper-hangings.

STATE UNIVERSITY SCHOOL.—We have received the catalogue of this flourishing institution, which is situated most pleasantly in our pleasant neighboring city of Oakland. Formerly known as the Oakland College School, its name was changed when the College of California became the University of California, as the former is in full sympathy with and a large contributor to the latter. This institution has always sustained a high reputation, of which it is still worthy. The names of 327 students show that its advantages are appreciated. The principal is F. M. Campbell, A. M., and all business communications should be addressed to Geo. Thit or S. T. King, Oakland.

FOR MONTANA.—Mr. L. Miner, an excellent and reliable business man, of this city, goes to Montana this week, and will represent the SCIENTIFIC PRESS for a short season in that Territory.

California Agricultural Notes.

STATE FAIR.—The managers of the State Agricultural Fair are making strenuous exertions to secure a superior exhibition this year—particularly of fine stock. To that end societies in the Eastern States are invited to coöperate, and bring hither improved horses, cattle, sheep, etc. Nothing could be devised better calculated to advance the stock interests of California. A full exhibition of improved stock would draw a large crowd of visitors to Sacramento, and secure a ready sale for the same.

RAPID GROWTH.—George Hohson, of Santa Clara, has a willow tree on his place 27½ inches in diameter, which he planted three years ago, a twig not larger than a pipe stem. The same gentleman last fall gathered 50 pounds of fine apples from a young apple tree which was set out in the spring of 1867. What country under the sun, asks the *Argus*, can heat this? There are seven-year old Australian gum trees in Los Angeles which are upwards of 60 feet high!

LONG LAMB'S WOOL.—Wool eight inches in length was clipped, a few days since, from a Cotswold lamb eight months old, and a sample eleven inches in length from one fourteen months old, both animals belonging to Mr. Thomas Brewer, of Lincoln. This is a very extraordinary growth; yet the *Butte Record* says it can be excelled by George Hamblin, of Dry creek, who has wool six inches long on a three-months' lamb.

THE CORN WORMS IN TULARE.—The corn in Tulare, according to the *Tulare Times*, is being much injured by worms, which enter the ear at any point at which they strike it, and eat out the grain. We believe no remedy has been found for this corn pest, which is so prevalent, generally, throughout California. The *Times* says that those who have wet land, and plant it late, generally escape the ravages of the worm.

GRAIN from the southern coast is coming rapidly forward, the harvest in that section being earlier than usual. The grain thus far received is in good order, and brighter than in previous years—a fact which is attributed to moderate rains, light fogs, and an early harvest.

THE olive crop promises everywhere to be abundant. Indeed, the olive is a never-failing crop, and always a profitable one. The manufacture of olive oil, in this State, promises to become an important one in the counties south of this city.

BROOM CORN.—Mr. Hamilton, two miles below Colusa, has a field of broom corn 80 acres in extent, which is already six and seven feet high. This is probably the largest field of broom corn in the State.

QUICK TRANSMISSION OF FRUIT.—Fruit picked and packed in the morning near Marysville, if shipped at 2.30 P. M., will arrive in this city, by rail, at 9 o'clock the next morning.

NORWAY OATS.—Large stories are told of the growth and promise in yield of Norway oats in this State and Oregon, the present season.

HONEY IN LOS ANGELES.—Several hundred tons of honey will be shipped to this city from Los Angeles county the present season.

THE hay crop, generally, throughout the State will be fully up to the average yield and quality the present season.

THE barley crop in the best districts of Los Angeles county is from forty to fifty bushels to the acre.

PREMIUMS to the amount of \$6,000 will be offered at the coming San Joaquin Agricultural Fair.

TOBACCO.—Daniel Woodford has a flourishing tobacco plantation at Fredericksburg, Alpine county.

Cultivation of Figs—How to Preserve Them.

The fig crop this season is large in quantity, and the fruit much larger in size than usual. So plentiful are figs in California this season that it will not pay to gather and send them to market. If parties who understand drying and packing them would publish a reliable recipe, they would confer a benefit on those who have quantities on hand that are spoiling on the trees for the want of knowledge to properly preserve them.

We clip the above paragraph from the *Folsom Telegraph*, and should be pleased to hear from any persons who may have experience or special knowledge in preserving or packing figs. In the meantime, we think we are not mistaken in saying that the process is very simple and may be described substantially as follows: Allow the fruit to remain on the tree until it becomes "dead ripe," then pick and dry upon boards or mats, care being taken that no rain falls upon it, as a few moments of rain will spoil the same. Care should also be taken that the drying process is not carried too far. While the pulp is yet moist and pliable, the fruit should be snugly packed (round boxes or "drums" are preferable) and stored in a moderately dry place about four months, during which time the gummy or mucilaginous pulp will be partially converted into grape sugar, a portion of which will find its way through the pores of the skin to the surface. During this process the peculiar flavor of the fresh dried fig, so unpleasant to some tastes, will gradually disappear by the chemical action which takes place. No sugar, or any other substance, should be added to the fruit. The most of the California produced figs which find their way to this market are dried too much before being packed.

The fig should be more generally cultivated in this State; our climate seems to be especially adapted both for growing and curing it. From the first settlement of the early missionaries, it has taken kindly to the soil here, particularly in the southern part of the State, where it yields abundantly, and where the fruit is nearly or quite equal to the same species grown in Greece or Turkey.

Figs form an important article of commerce in the Mediterranean, on the shores of which millions of dollars worth are dried and packed. Turkey, Palestine, Greece, Syria, Barbary, Italy and Spain are largely sustained by this product.

CALIFORNIA ON CANVAS.—The pioneer panorama of California, to which we hopefully alluded last week, was exhibited last Monday evening for the first time. We were pleasantly surprised at the views, for although we had previously had faith that they would be good, they were even better than we had expected. The scenes are painted with a care and fidelity very unusual in such cases. As one view after another was unrolled, the audience testified to its pleasure by applause, and when the well-known scenes about this city came into view the applause was very enthusiastic. The explanations were given by Prof. Knowlton, whose remarks were well calculated to interest and please. We doubt not that the panorama will prove the success which it certainly deserves to be.

CROPS IN OREGON.—The hay crop in Oregon has been damaged to some extent by the June rains. It is said that the last was the wettest June ever known in Oregon since its earliest settlement. Corn was slightly injured by frost, but, as a general thing, will do well. The *Sentinel* says the farmers are now cutting their wheat, and if the weather should continue favorable, there will be an abundant harvest. Small fruits are abundant and of excellent quality. Peaches, pears and apples are looking exceedingly well.

The Cincinnati Industrial Exposition.

Next September there will be held in Cincinnati a grand industrial exposition of manufactures, products and arts, to which artisans, manufacturers, inventors, and all engaged in the production of works of art and ingenuity are invited to contribute.

The influence of such expositions is so great and so beneficial, bringing together the various sections of our country and making them acquainted with one another, and inducing a generous rivalry in the peaceful arts, that we gladly give space for a notice of the present one, which is to be held under the auspices of the Chamber of Commerce, Board of Trade, and Ohio Mechanics' Institute of Cincinnati.

For the Exposition a large building, shown in the accompanying illustration, is expressly erected. Here ample arrangements will be made for the display of articles of all kinds. For running machinery there will be adequate power provided. The halls and grounds will be open for the reception of articles from the 1st to the 20th of September inclusive. On the 21st the Exposition will be opened to the public, and will continue opened daily from 10 A. M. to 10 P. M. until the evening of October 15th. Articles may be entered for exhibition only, or for exhibition in competition with other articles for premium. In the latter list only products of the United States will be admitted. Each exhibitor pays an entry fee of two dollars, receiving therefor a badge which admits him at all hours to the Exposition.

Applications for space must be made by the use of the blank forms which will be furnished, and should be made and entered on or before September 20th. Space allotted to applicants and not occupied by them on this date may be assigned to others. Contributors are requested to exhibit goods in glass cases, when possible. The management reserve the right to exclude articles of an explosive, dangerous or offensive character. Exhibitors will be furnished by the entry clerk with duplicate cards, describing each article entered for exhibition. These will be countersigned by the Department Superintendent on the receipt of the article into the Exposition. One of the cards are to be attached to the article which it describes and the other retained by the exhibitor and be presented as his order for the delivery of the article specified at the close of the Exposition.

Machines and other articles exhibited for premium will be subjected to thorough practical tests to determine their efficacy, economy, or other alleged merits. The judges will be selected from among those persons eminent for their skill and knowledge, and will be entirely disinterested. The hours from 8 to 10 A. M. each day will be appropriated exclusively to them, during which time no exhibitor will be admitted, unless at the request of the judges; and when the presence of an exhibitor is required, all others in the class in which he is a competitor will be permitted to attend. The premiums will consist of the General Committee's gold and silver medals and diplomas; also the General Committee's grand gold medal for best displays in several prominent departments. And in the published report honorable mention will be made of all meritorious articles.

No exhibited article can be removed during the Exposition without the consent of the General Committee; but all appropriate facilities for making sales of articles for delivery at the close of the Exposition will be afforded, and after the close there

will be an auction sale of such articles as the owners desire to offer, under the direction of the General Committee. During the Exposition adequate police force will be provided night and day, and insurance against loss by fire will be effected by the General Committee in behalf of all exhibitors who apply and provide for the same.

All communications relating to the Exposition, and all boxes or packages containing articles for the Exposition, should be directed to "Cincinnati Industrial Exposition," with the name and residence of the sender plainly marked thereon. A detailed statement of the contents of each box or package should be enclosed with the same or sent separately by mail.

Commencement Day.

The commencement exercises of the University of California were held at Brayton Hall, Oakland, on Wednesday last. The Regents left San Francisco for Oakland at 10 A. M., and on their arrival at the

CINCINNATI INDUSTRIAL EXPOSITION BUILDING.

SOUTH-WEST CORNER ELM AND FOURTEENTH STS.

ERECTED EXPRESSLY FOR THE EXPOSITION.

DIMENSIONS OF MAIN BUILDING AS SHOWN IN ABOVE CUT.

Front—Elm Street.....	110 feet.	Gallery Floors.....	12,000 square feet.	Clear height from center of main floor, 67 ft.
Depth.....	250 feet.	Stage.....	57 by 110 feet.	Clear height Gallery above main floor, 20 ft.
Main Floor.....	27,500 square feet.	6,270 square feet.	Clear height from gallery floor.....
Power Hall (in the rear, not shown in the above cut), 150 by 150 ft.				20 ft.
				Main floor of Power Hall, 22,500 sq. ft.

Broadway spot were received and escorted to the hall by the military companies, Col. John Scott, Marshal of the Day, commanding. At the hall the programme of the exercises was as follows: 1. Music. 2. Prayer. 3. Music. 4. The Twentieth Century—Lucio Marinatus Tewksbury, San Francisco. 5. Music. 6. Will—Robert Livingston McKes, Oakland. 7. Music. 8. The Best Possible World—Charles William Anthony, Santa Cruz. 9. Music. 10. Conferring of Degrees, by Prof. John LeConte, Acting President. 11. Address to the Graduating Class. 12. Music. 13. Closing Exercises. Prof. LeConte delivered the annual address, and Hon. Edward Tompkins, in conclusion, made an eloquent speech, during which he was repeatedly applauded. It was a proud day, for the Regents, he said, to see these young men, the three first graduates of our young University; the three first graduates of what was absolutely the first free University in the world. He spoke of the future prospects and growth of the institution and of the great influence on the country which it was certain to exert. He concluded amid great applause. The degree of Bachelor of Arts was conferred on David L. Emerson, an absent member of the graduating class.

IMMIGRATION.—We have in a late issue spoken at length concerning the California Immigrant Union. We have lately received from this association a pamphlet entitled "All About California." This is published for general distribution, and contains much information concerning our State, especially the available lands. It can be read with advantage by many here as well as by people abroad.

Notices of Recent Patents.

Among the patents recently obtained through Dswey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

SUPPLEMENTARY PEDAL ATTACHMENT FOR PIANO FORTES.—G. A. Scott and W. B. Frisbee, S. F.—In playing on a piano, the proper management of the pedals is an important item. It happens, however, that often the performer is not provided by nature with the requisite length of the lower extremities (commonly called legs) to reach these as generally constructed. To remedy this is the object of the present invention, which gives to the shortest person the full control of the instrument. It serves, moreover, to partially support the feet of the performer, and thus render him or her more secure upon the seat, which must always be high enough to be convenient for the key-board. The device consists of a box or frame of suitable size and shape, which stands upon the floor, partly over the pedals, the upper surface

Academy of Sciences.

At the regular meeting, on Monday evening, Mr. H. G. Hanks was elected Cor. Secretary, *vice* Eloesser, resigned. Dr. Blake read an interesting paper concerning the meteorology of the Pacific ocean, based on observations made during six consecutive voyages to Japan, by Capt. Doane, of the steamship China. These observations tend to confirm Dr. Blake's theory that climatic extremes are owing to equatorial and polar currents of air prevailing in broad belts over contiguous parts of the earth's surface for a considerable period. The Doctor gave diagrams illustrating the peculiar curves of temperature between this city and Yokohama, according to Capt. Doane. Mr. Yale read a paper on the Indian mounds at the Potrero. Mr. Saxe, of Santa Clara, gave some information of interest concerning the subsidence of the Santa Clara Valley and the artesian wells of San José. He remarked that fish occasionally came up from the wells, and saw-dust also; neither, however, were to be supposed to originate in subterranean sources. Prof. Davidson stated that in the well of the C. P. R. R., at Oakland Point, at a depth of 206 feet the tools passed through a redwood log, seven feet in diameter, both wood and bark of which were sound. At this depth the flow of water was materially influenced by the tide in the bay; at high tide the increased pressure producing an increased flow. Mr. Hanks spoke of the interesting occurrence of Hayasine (horate of lime) in Nevada, and showed a beautiful specimen of crystals.

NATIONAL EDUCATIONAL CONVENTIONS.—The series of Educational Meetings to be held this year at Cleveland, Ohio, commences on the 15th of August. On that and the following day the National Normal School Teachers' Association meet, and

on the three following days the National Teachers' Association will be in session. Addresses and papers will be delivered and read by many prominent gentlemen. For the benefit of members, arrangements have been made with railroad companies for reduced rates of fare, and also with the hotels and omnibus companies at Cleveland. The Central Pacific Railroad will issue round trip tickets from San Francisco or other points, at certain reduced rates, to be arranged for by parties desiring the same. Teachers who attend the convention and desire to avail themselves of the above reduced rates must, before they leave home, obtain certificate that they are persons properly entitled thereto, by applying by letter or otherwise to Andrew J. Rickoff, Superintendent of Instruction, Cleveland, Ohio.

INFALLIBILITY.—On the 13th inst. the Ecumenical Council decided that the Pope was infallible by a vote of 450 for, and 83 against, the dogma. It is stated that there were 66 conditional votes; but what the condition was, is not stated.

TO SAN JOSE.—On the 18th, the Central Pacific Railroad commenced running two trains daily to San José from Oakland. Passengers leave San Francisco at 9 A. M. and 4 P. M.

CALIFORNIA BLANKETS.—A. T. Stewart, of New York, has given the Mission and Pacific Woolen Mills, of Vallejo, orders for blankets which will keep them busy the rest of the year.

M. D. LASSWELL has been awarded the \$500 premium for the best models of two wheels for the Mercantile Library lottery.

being considerably elevated above the floor. Upon this are hinged the supplemental pedals, which have light springs, to return them after being depressed. Two arms extend down from the lower sides of these pedals, and are provided with a sort of foot, which rests upon the true pedals of the piano, so that any motion given to the false pedals will be communicated to the real ones. The usefulness of the device will be appreciated by all teachers, and, indeed, the invention was prompted by long experience on the part of one who is well known to the musical public of San Francisco.

DOUBLE-ACTING OSCILLATING ENGINE.—Thomas Hill, Vallejo, Cal.—The nature of the invention is the construction of an improved horizontal, double-cylinder, oscillating engine, which is more especially applicable to double propellers, and is intended to be used upon the steam ram, for which separate patents have been issued. The engine is constructed with two short cylinders of large diameter, placed side by side and oscillating together on the same pair of trunnions. One steam chest and one valve only are employed. The induction or steam ports of each cylinder are separate, but both exhaust into the same education port. The valve is operated by a peculiar mechanism which can be arranged to cut off as desired. The cranks are so constructed that they balance, and cause no undue strain on the machinery. To understand fully the operation of this neat and ingenious device an illustration is necessary, and one will probably shortly appear in our columns.

ST. LOUIS IRON WORKS.—A company has been organized at St. Louis, with a capital of \$5,000,000, for the purpose of establishing works for the manufacture of steel rails and pig iron. The works will cost about a million of dollars, and are to be called the Aetna Rail and Iron Works.

Metallurgy and Ores.

MINING SCHOOL.

Mosheimer's Practical Mining School
Will be reopened by the FIRST OF JUNE, and practical
instruction given in all branches of Assaying,
Crushing, Amalgamating, Concentrating, Smelting and
Refining Ores; also Erecting Furnaces and Reduction
Works of every kind. To give all miners a chance to
learn Assaying of Ores (what everyone ought to) I have
reduced my former charge for
Assaying Ores. \$ 50.00
To work Gold and Silver Ores. 100.00
Smelting and Refining, including Assaying. 150.00
Many gentlemen who have been taught in my estab-
lishment will bear testimony that in a few days they
learned more than they expected to learn in a month.
Before going into mining, every man ought to know
how to test ores, and then he will go to work with pro-
vidence and never fail to be successful. Apply to
J. MOSHEIMER,
Office, 328 Montgomery street; Works, 2,005 Powell
street, San Francisco. 22v23-3m

A. T. GREEN,
COMMISSION MERCHANT,
No. 3 Front Street, San Francisco.
Agent for SAMPLING, CRUSHING, ASSAYING and
SELLING OF ORES. Shipments received from miners
and the entire business transacted with promptness and
accuracy. MERCHANDISE of all descriptions pur-
chased and shipped on Commission for Country Mer-
chants. Consignments of PROVISIONS received and
sold at the highest market prices.
Refers, by permission, to Jas. Linforth, of Linforth,

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others. We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

IMPORTANT NOTICE.

On SATURDAY, THE SIXTH DAY OF AUGUST, we propose publishing an

IMMENSE DOUBLE-SHEET EDITION

— OF —

THE SCIENTIFIC PRESS,

Containing about sixty columns, devoted exclusively to information concerning the

Agricultural, Manufacturing and Other Resources of California,

ENTITLED,

"A GUIDE FOR EMIGRANTS TO CALIFORNIA!"

Great care and much labor has been bestowed upon the compilation, in order to supply a much-needed want—viz: reliable facts in a condensed, readable and cheap form for the use of persons abroad desirous of emigrating to CALIFORNIA.

The following will be the most prominent features embraced:

Climatic and Soil; Natural Wealth and Resources; Productions in Agriculture and Manufactures; Past, Present and Future of the State; Agricultural Districts; Public Lands; Laws Relating to Pre-emption and Homesteads; Tables of Statistics from Official Reports; Lands for Sale; Railroads; Routes of Travel; Methods and Cost of Travel; Distances; Suggestions to Immigrants, etc., etc.

Each regular subscriber to the SCIENTIFIC PRESS and those purchasing single numbers on the day of issue will be entitled to one copy free of charge. Extra numbers will be sold at 15 cents per copy, or \$10 per hundred, and will be mailed to any address on receipt of remittance by Post Office Order or otherwise.

All persons desirous of promoting the growth and development of California, and wishing to communicate facts to their Eastern or European friends, can, at a trifling cost, avail themselves of the present opportunity.

A limited number of ADVERTISEMENTS will be inserted at reasonable rates.

DEWEY & CO.,

Publishers Scientific Press, 414 Clay Street.

San Francisco, July, 1870.

Mann's Patent Earthquake (and Fire) Proof Chimney.

This invention affords a real improvement, which is much needed in this section of country, and as it is just as cheap, can be built more quickly, with less trouble and always perfect, it is very desirable and likely to supersede the old style of chimney.

The chimney is constructed entirely of metal. The lower portion, made of cast, sheet or boiler iron, with a proper opening for a fire-place (which may be built of brick), is of any suitable shape and is intended to rest upon any foundation or upon the floor, if desired, as the whole weight of the chimney will not exceed six or seven hundred pounds. The left-hand figure shows the general appearance of this lower portion. On the right is the chimney-flue, shown in section also, in the middle figure, and below this, is the cover for the lower portion.

The flue is cylindrical and consists of two pipes, one inside of the other, with the annular space between them filled with cement, plaster of paris, asbestos, or other non-conducting material. This flue is secured to the cover, which is fastened to the lower portion of the chimney by rivets or other proper means. The illustration shows the device with one fire-place and one flue. But it can easily be constructed for two fire-places, opening into adjoining rooms on opposite sides of the chimney.

The chimney may be placed directly on the floor, if necessary, and any suitable fire-proof fire-place can be constructed in the recess in the lower portion. Heating stoves may be connected with it at any point, and thus the heat is utilized for warming rooms to a very great extent. It is so light that it is quite applicable when a fire-place is needed only in the upper story or stories of a building. The exposed part of the iron can be painted so as to represent brick-work, or ornamented as desired.

Besides this possibility of a cheap and easily-constructed chimney which can be placed in any room, are to be added its fire-proof qualities. As the pipes are made breaking joints, there is no danger of fire should the chimney be racked. This is a point of no small importance.

It cannot be shaken down by an earthquake unless the house comes down with it.

It is absolutely fire-proof, as it is impossible by this construction to have such a thing as a defective flue.

It does not take up one-half the room of a common chimney.

These chimneys can be constructed of different sizes and styles and kept on hand for sale, so that they can be ordered and set up at once, greatly facilitating rapid building in the country or city.

The inventor offers part of the patent right for sale. He will contract for chimneys on liberal terms. Address the inventor and patentee,

2v21-1m

BENJAMIN F. MANN, Oakland.

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted \$3,500
Second—For the second best design and plan 2,000
Third—For the third best design and plan 1,500
Fourth—For the fourth best design and plan 1,000
Fifth—For the fifth best design and plan 500

The premiums payable in City Hall warrants. As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. OANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

ELLWANGER & BARRY,
ROCHESTER, N. Y.

Reading for the Hour.

GERMAN MILITARY DISCIPLINE.—A correspondent of the *Pall Mall Gazette* at Coblenz, writes: "A painful impression has been created here by the following incident: Three soldiers of the line were undergoing a long period of imprisonment in the fortress of Ehrenbreitstein, for desertion. They had originally deserted at Sarlois and crossed the frontier into France, but, on the persuasion of their families, had surrendered themselves to their regiment. Their term of punishment was seven years, of which only six months had expired. Finding their lives, as it is asserted, insupportable, they determined to drown themselves on the first favorable opportunity, as a preferable fate. A few days ago they were employed on the Carthause, the fine plateau which separates the Rhine from the Moselle, and it seemed a fitting moment to attempt their rash enterprise. One sentry alone was in charge of them, and he witnessed their flight. He immediately fired and brought one victim down dead, the bullet having passed through his head. With extraordinary sang froid and determination he loaded a second time, and again fired with fatal precision; the deserter fell dead, pierced through the heart. One more loading he fired at the third fugitive, and the bullet passed completely through his body, inflicting a frightful injury to his intestines. The unfortunate man was conveyed to the military lazaretto in Coblenz, where he lies in a hopeless condition. In military circles this melancholy catastrophe is regarded as a fitting retribution for a grave breach of discipline, a view of the case not altogether shared in by the civil portion of the community. One thing is certain, the needle-gun in the hands of a good marksman is a sure and terrible weapon."

RAILROADS IN COLORADO.—The Central City *Register* speaks as follows of the railroads in that Territory:

The Denver Pacific Railroad is completed. The last rail was laid, the last spike driven, the fillings made, and the finishing touches given in the presence of a large and cheerful assemblage of citizens on Friday, the 24th of June. The link which connects us with the two great oceans, and secures to the Territory a solid basis for all her projected and to be projected enterprises will, within 70 days, be further strengthened by a union with the Kansas Pacific Railway, now rushing rapidly onward from Kit Carson. Nearly 40 miles of track are in operation this side of Carson, and a large force began putting down iron on the Denver end. We are informed by the managers that if the Indians do not seriously interrupt the work of tie-cutting and transportation, they can complete their road to a junction with the D. P. before the end of August. Engineers have been over the high-grade line to Central City, taking careful observations along the entire route, and report that there is nothing in the way of building such a road to Central City on an average grade of 60 feet to the mile, and a maximum of 70. The Colorado Central Company are busy perfecting their plans, which will come to fruition to our advantage in the due course of time.

DESTRUCTION OF FORESTS.—The destruction of forests is progressing this year at a fearful rate. It is not sufficient that such inroads should be made for lumber and fuel, but fire is called into requisition, and whole acres are burned out. A short time ago there was a terrific fire in northern and central New York. Now we are getting detailed accounts of the late fire on Long Island, where an area of some 3,000 acres was burned over, and, moreover, 500 cords of cut wood were destroyed. When our forests have disappeared perhaps people will wake up to the idea of their value.

The *Mariposa Gazette* learns that a streak of lightning struck a portion of the South Dome in the Yosemite Valley, one day last week, and those who had the good fortune to see it at the moment describe the scene as terrific as well as grand. Hundreds of tons of rock were loosened, and sliding and bounding down the side, left in its track a streak of fire, smoke and dust, and the noise therefrom sounding in the canyons like the shooting of heavy artillery.

THE CRIMINAL CLASS IN PERU.—No such thing as a single pickpocket or burglar exists in Peru, the stealing all being done by large gangs of horsemen and in broad daylight, on the outskirts of the town, and in lonely and solitary grocery and produce stores, etc., in the suburbs. During the frequent revolutionary disturbances the police and watchmen, who always carry guns and not pistols, have orders to shoot down, without hesitation, any person seen alone on the housetop; and as many an offensive and thoughtless foreigner or American has been shot down and killed for simply going up on the flat roof of his house in the night time, it has so intimidated the negro or Cholo thief that they dare not be seen prowling around alone after nightfall, and if seen in company with several of their kind after dark, they know they are sure to be followed and watched by the police. So that for a city of such wealth, with so many diamonds, silver and gold, and such costly dressing by the fair sex, Lima is less infested by robbers than any city in the world, and even any city of twice the watchmen. Many families, whose silverware is not plated, and whose display would tempt a burglar in one night in New York, go to their beds at night after night without even locking their area doors or back entrances; and although the petty pilfering of household servants in small articles is almost of daily occurrence, yet such a thing as a wholesale burglary is never known here. —*Letter from Lima.*

SHAMEFUL DESTRUCTION OF TROUT.—We learn from a resident of this city who has just returned from a trip through Nevada, that the trout in Truckee river are being ruthlessly slaughtered. Some avaricious individual has constructed a dam and trap, and as at this season the fish are flocking up the streams in great numbers, their destruction is enormous. It is a matter, our informant says, to be condemned, not so much so on account of the number taken away, as because of the shoals upon shoals that are killed at the dam by falling back, unable to cross it; their remains form a heap of corruption and decaying matter, the stench of which is unbearable. Scales have been put up on the spot, and fish are being retailed in unlimited quantities for various towns along the road. The Fish Commissioners appointed by the recent Legislature were informed of the matter, and were very indignant at the fact of the proper authorities neglecting to interfere in the premises when called upon. They themselves are necessarily powerless, but they have intimated their intention of using vigorous measures to put a stop to this ruinous practice wherever they find it in vogue. —*Bulletin.*

AMERICAN VERSUS ENGLISH MANUFACTURES.—The London *Ironmonger* contains the following: "Our readers should certainly have their attention invited to the fact that we are running a great risk in England of being beaten by America in the manufacture of axes, shovels, hoes, spades, and other implements of the kind. It is asserted that the Pittsburgh steel, both cast and rolled, is fully up to the mark of the best English—in fact, to such a degree that it is not only supplanting our produce, but in every shape of tool being largely exported to the Continent. American bolts and hinges are said to excel ours, and medium American cutlery of all kinds to be cheaper and better than any manufactured, whether here or in other countries. We trust that our Sheffield house will look to their laurels, and still maintain the superiority of make and world-wide command of the trade, of which they have hitherto been so justly celebrated."

The ladies of Pittsburg are "on their muscle." On July 17th there was a sculling race, of one mile, on the Monongahela (the name brings up endearing reminiscences) river, between Miss Lottie McAllie and Miss Maggie Lew. Miss McAllie won in 18 minutes and 54 seconds; but Miss Lew says that she can't do it again. The excitement was tremendous.

Local earthquakes are getting to be the fashion. Gilroy had one all to itself a short time ago, and now Fort Tejon follows suit. We rather like this idea of breaking up an earthquake and taking it in such small doses that it does no harm.

Russia now has a very large manufactory for war material at Perm, where some immense guns are being turned out.

REPORTED APPEARANCE OF PONDS.—The *Saratogian* reports that at Wilton, N. Y., about two miles from Saratoga, water has suddenly appeared. The district is a slightly elevated table land, the soil a sandy loam. The surface is broken and undulating. It is a good farming district, the section in which the ponds have appeared being dotted with neat farm houses, and occupied by some of our most prosperous farmers. On this strip of land, covering an area of a mile broad by two miles in length, have appeared this spring ten or a dozen good sized ponds, varying in size from one acre to six or seven acres in extent, in spots that have hitherto hardly known a puddle, and in some instances in the fields where the farmer has been wont to reap his richest harvests. They mostly came in April, and only within a short time have they begun to subside. In some places they have passed the highway, and the grounds still bear the marks of the water. In addition to the appearance of these ponds, the wells and cellars of the residents all through this particular section have been, and are at present, flooded from one to three feet deep. The wells have from five to seven feet of water in them more than was ever known before. There has been much wondering over this singular phenomenon in Wilton, but nobody has found a satisfactory solution of the mystery. It is a curious fact, however, and may be in some way connected with the phenomenon that a couple of miles east of this section, but on lower ground, the water is considerably lower than it has been known for years, and on the opposite side of the Adirondacks Ridge, in Corinth, the water is full two feet lower than it was one year ago. But why water should thus suddenly appear in this strange way, on this sandy table land, is thus far unexplained, and must be left for the savans to philosophize upon.

The copper mines of Lake Superior region are ceasing operations. The production of copper, it is reported, was overstimulated by the demand during the war, and the result has been the accumulation of a large amount of stock. The product of the Lake Superior mines in 1869, was 23,493,079 pounds of ingot copper, and notwithstanding a reduction of 2,771,000 pounds by the closing of the principal mines, the yield for 1870, it is estimated, will amount to 23,000,000 pounds. This circumstance is accounted for by the fact that other copper mines have increased the production to the extent of 2,000,000 pounds. It is calculated that 2,500,000 pounds remain on hand from last year's operation, and that the Vermont, Tennessee and Baltimore smelt works will produce 6,000,000 pounds, and that adding the above figures to the yield of the Lake Superior region, will be 31,500,000 pounds of American copper in the market this year. —*Iron Age.*

RESULTS OF SARGENT'S BILL.—The Nevada *Gazette* says that there is now a rush for claims for auriferous deposits which are too poor to pay for working in the small claims allowed by the customs of the miners. The Grass Valley *Union* says: "Since the passage of the bill the work of locating mining claims in the northern part of this county is going on with great activity. It is probable that the old river channels known to exist on 'the ridge,' will soon be on the heads of bona fide owners. When it is considered that before a title to any of these claims can be had from Government, \$1,000 worth of work must be done upon each claim, or set of claims, the mere act of preparing to get good titles will revive industry and create taxable property. We think the new law starts out well."

One of the biggest reptile stories yet is that of an alligator near Midway, S. C., which a planter has used in harness to do his plowing. The animal weighs 350 pounds, and is said to be perfectly docile and thoroughly "broken in" to his work.

The *Alta* says that four of the seven sugar pines in the Yosemite valley have been cut down by the sub-guardian. It looks as if the sub-guardian might need a severe cutting down.

AN AMERICAN abroad says that Prof. Huxley is the only man he met in London who ever heard of the Yosemite valley.

Mexico is again rejoicing in wonderful piratical efforts of some of its most distinguished citizens.

THE ELECTROTYPERS' MANUAL.—William Stuart Spiers, of Buffalo, N. Y., has issued a pamphlet of 34 pages, under the above title, which should be read with profit to all engaged in the art of electrotyping, and also by printers, who will be much benefited by better understanding the terms and methods employed by those who do their electrotyping. We notice that among the comparatively few inventions patented in this branch of industry, several are accredited to Mr. Wm. Filmer, of Faulkaer & Sons' type foundry, in this city, who is one of the pioneers in practical electrotyping in the United States. Copies of this pamphlet can be had for 50 cents, addressed as above.

A STRIKE is reported in the Confidence gold mine, near La Paz, paying \$1,000 per ton. —*Exchange.*

Mining is the only business in which a strike pays,—proving the superiority of mining.

MARAVILLA COCOA. For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

A VALUABLE BOOK FOR INVENTORS AND ARTIZANS.—Dewey & Co., publishers of the *SCIENTIFIC PRESS* and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the *SCIENTIFIC PRESS* office, postpaid, for \$1.—*New Age.*

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the *Scientific Press*, San Francisco.

LAYBRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., *Scientific Press* Office.

MULLER'S Brazilian Spectacles are just the thing for people fond of reading whose eyesight is beginning to fail. His great skill as an optician enables him to suit all conditions of sight. It is Muller who supplies the city with opera glasses. *

DR. HARMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye, Opacities of the cornea cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 314 Bush street. 25-520.

IMPORTANT TO PATENTEES.—The undersigned desires the General Agency for New England States and Massachusetts for saleable patent articles, through agents and retail dealers. Address HOSMER & Co., Old State House, Boston, Mass. 4v21-2v

VAST QUANTITIES OF IVORY DESTROYED.—Thousands of teeth that might last a lifetime are lost every year, simply because the parties concerned either forget or do not appreciate the fact that SODONOT, duly applied, renders the dental substance proof against decay.

ACCIDENTS WILL OCCUR EVEN IN THE BEST REGULATED families, and "SEALDING'S GLUE" should be kept on hand *

JAS. A. SULLIVAN, of Calaveras county, is requested to call at this office, or address us, on business. *

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms.

New Mining Notices.

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of July, 1870, an assessment of two dollars and a half (\$2.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.
Office, 220 Clay street, San Francisco. jy23

Mountain City Mining Company.—Location of Works: Cope District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of July, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. jy23

North America Consolidated Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of June, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventh day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5 No. 302 Montgomery street, San Francisco, Cal. jy23

Noonday Silver Mining Company.—Location of Works: White Pine Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of July, 1870, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1870, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the thirteenth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. ELLIOT, Secretary.
Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. jy23

Pogonip Flat Silver Mining Company.—Location of Works: White Pine, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of June, 1870, an assessment of three (3) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, No. 1 Express Building, northeast corner Montgomery and California streets, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of August, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. J. OWENS, Secretary.
Office, No. 1 Express Building, northeast corner Montgomery and California streets, San Francisco. jy23

POSTPONEMENT.—The day for advertising delinquent list of the above Company is hereby postponed to the second day of August, 1870, and the day of sale to the eighteenth day of August, 1870. By order of the Board of Trustees.

T. J. OWENS, Secretary. jy23

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SERIES COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. jy16-jy16p

THE SCIENTIFIC PRESS.—Mr. W. H. Murray, special traveling agent for the Scientific Press, is a very sensible and pleasant gentleman. He speaks in high terms of the mineral resources of Owyhee, and predicts for our camp a bright future. After examining the mineral and agricultural resources of Idaho, he will proceed overland to Montana and Colorado. He has secured quite a large list of subscribers for the Scientific Press, which is devoted to mining, farming and the mechanical arts, and is inferior to no publication of the kind in the United States.—Advertiser, June 18th.

ENCOURAGING REMARKS.—One of our readers writes:

"Incorporating an agricultural department into your paper has made it acceptable and really useful all over the country west of the Rocky Mountains, and probably further; and for my part I do not see how an intelligent farmer, miner or mechanic can do without it."

HIBBERD, SANBORN & CO.,

South Point Mills, Berry Street, Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.

Greatest Discovery Ever Made.

MR. J. W. MAC, while a resident in New Zealand, was so afflicted with the RHEUMATISM, that for years he was completely crippled and unable to attend to business. The symptoms were of the worst type—knees painful and swollen, with sinews contracted; shoulder, arm and hand rendered useless, and accompanied with continued excruciating pain. While in this state of suffering, he got acquainted with a native of the country, who applied to the parts affected a composition spread on coarse canvas, the properties of which were so wonderful that in a short time all the pain left him, the swelling disappeared, his sinews relieved, and he was able to resume his usual avocations. So effectual has been the remedy, that to this day he has enjoyed perfect health, without the slightest return of his former complaint. Knowing the great blessing such a remedy would be to those afflicted with this painful disease, he with great difficulty and expense obtained the secret of preparing the Plaster; and during the many years MR. MAC has applied these Plasters in New Zealand, Tasmania, New South Wales, and this city, their effect has been marvelous, giving to the most painful and long-standing cases sure and certain relief. The most incredulous will be convinced by referring to these persons: B. W. Owens, 405 Front street; F. B. Alderson, Traveling Agent for Dewey & Co., 414 Clay street; James Flynn, 519 Mission street; Michael Gorman, No. 6 Front street; Mrs. W. S. Wright—late of Gilmore House—518 Folsom street, now agent at Virginia City; E. Shanley, corner Montgomery and Filbert streets; W. M. McLeod, Depository American Tract Society, 557 Market street, and a host of others, who all bear testimony to the unparalleled healing powers of J. W. MAC'S (rightly termed Magic) Plasters, for the cure of Rheumatism, Gout, Weak Loins, Tender Feet and Neuralgia. J. W. MAC may be consulted at his office, rooms Nos. 34, 35 and 36, 128 Kearny street, San Francisco, between the hours of 9 to 12 A. M., 2 to 4 P. M. and 7 to 9 P. M. 18x20-3m

FROM THE WEED Sewing Machine, the WHOLE WORLD being judges—as they are the LAST, so they are the BEST! Why? Because the WEED Machines work easier, simpler, and with more VARIETY. Buy the LATEST always. Call and see S. E. How, 329 Kearny St. S. F., Ast.

DR. ABORN

Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Anzerals House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

Dr. ABORN—I take pleasure in bearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted. Oakland, June 3, 1870. WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patients to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon. James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary means of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1x21-2m 22x20

NEW VOLUME, JULY 1, 1870.

Best Illustrated Newspaper

—FOR—

PACIFIC COAST READERS.

The Scientific Press,

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to

Mining, Farming, Mechanic Arts, AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the Press and illustrated Patent circulars sent free on receipt of postage stamp.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at
the Paris Exposition.Patented Nov. 1st, 1864, July
24, 1866 and Oct. 9, 1866.

ADAPTED

FOR

Smelting.

Foundry.

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Atna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottom, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

1v1

Mr. S. H. HERRING, agent for the Scientific Press, has called upon us, and is now in town. He informs us that the Press is rapidly increasing its circulation. We are pleased to hear it, for it is a journal that all should read. Valuable to farmers as well as miners, mechanics and others.—Pajaronian, June 16th.

WHAT IS HEADACHE?—In nine cases out of ten the source of headache is not in the brain, but in the stomach. Indigestion is the most frequent cause. The digestive organs being disordered, they derange the action of the liver, the bowels, the kidneys, and the nerves, and the whole secretory and excretory machinery being as it were thrown out of gear, the brain suffers. Restore the natural tone of the stomach and bowels with a few dozen of TARRANT'S EFFERVESCENT SELTZER APERIENT, and headache arising from this cause is at once arrested. This delightful preparation is the best remedy for chronic and periodical headache at present known, and absolutely invaluable as a stomachic and gentle cathartic.

SOLD BY ALL DRUGGISTS.

The Great Family Medicine of the Age—THIRTY YEARS have elapsed since the introduction of the Pain Killer to the public, and yet at the present time it is more popular and commands a larger sale than ever before. Its popularity is not confined to this country alone; all over the world its beneficial effects in curing the "Pain" that flesh is heir to, are acknowledged and appreciated, and as a PAIN KILLER its fame is limited to no country, sect or race. It needs only to be known to be prized.

THIRTY YEARS is certainly a long enough time to prove the efficacy of any medicine, and that the PAIN KILLER is deserving of all its proprietors claim for it is amply proved by the unparalleled popularity it has attained. It is a sure and effective remedy, sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directions accompany each bottle. 4v21-1m

ROASTING OF GOLD AND SILVER ORES,

—AND THE—

EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

By G. KUSTEL, Engineer and Metallurgist; author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of All Kinds of Ores." 145 pages, 12mo.
Illustrated by Numerous Engravings.

TABLE OF CONTENTS.

I. INTRODUCTION.

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chlorine.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Changes in Roasting.
B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverse.

ratory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Park's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimneys and Flues.

III. EXTRACTION OF SILVER BY LIXIVATION.

C. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patena Process; Kiss Process; Patena and Rosner Process; Kustel and Hofmann Process; Augustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets.

Published and sold by DEWEY & CO., SCIENTIFIC PRESS OFFICE, 414 Clay street, San Francisco. Price, \$2.50 coin, or \$3 currency. Postage, 12 cents extra.

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for drying, and can be folded as compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

A NEW CORK EXTRACTOR.

This is a simple device of practical utility. It is adapted for Hotels, Saloons and family use. The tightest cork can be drawn with a mere nominal outlay of strength, and without any risk of bruising or hurting the hands. They will be furnished, plain or silver-plated, at manufacturing cost, to parties purchasing Rights. Any person of energy can soon realize the cost of a State Right by selling the Cork Extractors, as they sell readily and afford a large profit. Send for circular.

NEW LIGHT ON A NEW PRINCIPLE.

Gas for everybody in the city and in the country. Equal to coal gas at one-half the cost. The gas is generated and burned in a new style Vapor lamp. No wick, no chimney, no explosion; and no man who is out of business and has a few dollars should fail to purchase a County or State Right and commence making money. Parties owning territory get the Lamps at Manufacturer's prices. Call and examine the light, or write for particulars.

STEAM COOKER.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

SWIMMERTON'S MECHANICAL MOVEMENT.

Every steamboat should have a Pilot made on this principle. It is particularly adapted for the application of power to Steam propellers. Send for circular.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces.

CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible Co.—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any others.

Melter and Refiner, U. S. Branch Mint, Eagle Brass Foundry, 206 Fremont street, San Francisco. 12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen.—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore.

Messrs. A. S. Hallidie & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them as superior to any we have yet tried, although we have used every not obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

CALLAGHER, WEEB & CO., California Brass Works, 125 Front street, San Francisco. Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs. A. S. Hallidie & Co.—Gentlemen.—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucibles of Dixon's make over Adams, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and economy. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
519 Front street, San Francisco

The Burro Mountain Mines.

We are enabled this week to present our readers with a sketch of these now famous mines. On account of the length of the ledges, the sketch is made in two parts, the lower being a continuation of the upper. The cuts give a birds-eye view of the place, abowing how the different ledges run in various directions, and bow they crop out holdly from the surface. The engraving is from a drawing made on the spot and furnished us by the locators.

Roberts, and made certain statements regarding croppings or float rock seen by him, three or four years previously, in the vicinity of Leidersdorff's Wells, on the old Butterfield and Texas road. These statements led to Mr. Brown's being connected with Mr. Arnold's party, which left here in January for the place indicated by Mr. Brown. At Fort Bowie a military escort was procured. Proceeding to Leidersdorff's Wells, supposed to be in Grant county, New Mexico, they found the float rock described by Mr. Brown but no leads

citement was caused, and the people of Tucson, and of the settlements on the Rio Grande flocked to the place. The town of Ralston was founded in the vicinity of the most promising mines, and contains at present a population of two or three hundred persons. The altitude of the place is probably eight or nine thousand feet. The climate is represented as healthy, the temperature ranging between 60° and 85° during the year. Having two rainy seasons, one beginning in July and ending in August, the other commencing in Decem-

vicinity; the growth is small and consists of nut pine, cedar and several varieties of hnsb-wood. Large timber, however, similar to that on the Sierra Nevada, can be obtained on the higher ranges of the Burro Mountains, 20 to 30 miles distant, or anywhere in the neighborhood of the Rio Grande, 50 to 60 miles distant. Two sawmills are now in operation in the Mexican settlements within 60 miles, and good lumber can be obtained under contract for less than \$100 per thousand. Beef, flour, poultry and vegetables can be

SKETCH OF THE LEDGES AND LOCATIONS AT THE BURRO MINES, GRANT COUNTY, NEW MEXICO.

The history of the discovery of these mines has been published in several papers, but not exactly as it actually happened. We have obtained therefore the following facts from headquarters. It seems that last July Messrs. A. Harpending and G. D. Roberts, of this city, sent out a party under Mr. Philip Arnold, an old California miner, to explore Southern Arizona. After a pretty thorough examination of the country around Tucson, Mr. Arnold returned in December, without having made any very satisfactory discovery. As, however, he was favorably impressed with the country, it was decided to send him again to make a more extended exploration. In the meantime, Mr. W. D. Brown called on Messrs. Harpending &

in that immediate vicinity. Far up on the crest of the mountains, however, they could see long high walls running in an easterly and westerly direction. Following the rich float rock, it led them about three miles up a gentle declivity to these walls, which proved to be the sides of monster ledges, the sources of the prodigal display of float rock which was scattered over an area of several miles below.

A district was at once organized, the "Virginia District," a recorder elected and claims located. After two or three days, the signs of Indians induced them to return to Fort Bowie, forty miles distant. Messrs. Brown & Arnold returned to San Francisco with samples of the ore and reported concerning the mines. A great ex-

ber and lasting five or six weeks, the amount of moisture is said to be amply sufficient to make it an excellent pastoral country. The valleys are rich and extensive enough to support a largo population; pure water can be had almost anywhere by sinking wells, the water frequently coming to the surface. The nearest stream is the San Simon, fifteen miles off, which contains excellent water, and enough of it for any city. The Rio Grande is fifty miles distant, a gently declining plain intervening. As the survey for the Thirty-Second Parallel Railroad passes through the town of Ralston, and to the Rio Grande, at no distant day these two points will be advantageously connected.

Wood is not abundant in the immediate

furnished from the Mesilla Valley and other Mexican settlements, and from the American settlements on the Rio Grande, on equally favorable terms as in the interior of the State of Nevada. Freight is ten to twelve cents per pound (in greenbacks) from Chicago or St. Louis via Sheridan; but machinery which is free of duty, can be taken at a less rate via Guaymas, which is the nearest seaport, (with good roads), 350 miles distant. The road via Tucson and Fort Yuma to San Diego, is 700 miles long, and to Los Angeles it is about 750 miles. The nearest telegraph station is Santa Fé, which is probably not over 300 miles off. Tucson for the present and for some time to come will be the distributing point for the mines. There will

be a strong competition for the trade from the East, as this place grows up, and if it were not for the large interests in the mines represented in this city, the bulk of this trade and billion might seek an Eastern market.

There is an old Mexican legend that in this locality, over a hundred years ago, mines were located by some Jesuit Missionaries from Durango, who, however, were finally all destroyed by the treacherous Apaches. This story receives considerable credit from the fact that there are evident marks here of work performed many years since. In the Harpsding mine a cut extends several hundred feet parallel with, and near the centre of, the lead, whence all the ore up to the surface has been removed,—indicating a rich strike. Near the Roberts mine was found a small stone house with solid walls of masonry. Also in clearing out a spring near by, a few feet below the surface, stone and mortar walls were discovered.

Within a hundred miles, in a southerly direction, are the celebrated Corralitos mines, which have been successfully worked for over a century. The Burro mines are in many respects of the same character as, and in the range of, the famous mines of Mexico which have produced so lavishly.

The country rock around appears to be principally slates. Sun, rain and time have been wearing away this softer rock and leaving exposed the hard quartz, until the miner has but to select the most desirable locality for his blast and then quarry out the rock, without timber or windlass, in the broad light of day. Taking into consideration the cheap Mexican labor, the mild climate and the fertile valleys near by, these mines are certainly more favorably situated than would at first appear, judging from their isolation.

The ore we have had no opportunity to examine carefully, but expect to receive a set of specimens in a few days. It contains, we believe, silver in one or more combinations, with more or less pyrites, galena, etc., the respective amounts varying considerably in different parts of the ledges. As to the amount of silver, we have been furnished with the certificates of all the assays which have been made here. They are from Riehn, Henne & Co., the California Assay Office, Leopold Kuh and the San Francisco Assaying and Refining Works, and number thirty-two in all. The lowest shows \$3.01; the highest, \$4,861.09. They run as follows: \$3.01; \$10.37; \$14.14; \$18.84; \$28.25; \$28.35; \$30.17; \$43.96; \$46.10; \$50.23; \$53.38; \$55.97; \$66.76; \$113.13; \$118.26; \$130.81; \$147.21; \$158.03; \$172.80; \$224.37; \$287.21; \$471.24; \$528.78; \$561.88; \$742.24; \$751.87; \$831.80; \$1,342.50; \$1,442.43; \$3,038.62; \$3,838.46; \$4,861.09. A little gold, from a trace up to \$25.22, was found in six samples.

The following is a list of the locations made by the prospectors and the sizes of the croppings. Some of the figures in the last column are very large. The parties all agree, however, that if anything, the figures are too small rather than too large:

Claims.	Length.	Croppings.
Arnold.....	1,400 ft..100 ft. wide,	20 ft. high.
Brown.....	1,400 ft..100 "	20 "
Harpsding.....	1,600 ft..150 "	60 "
Stonewall Jackson.....	1,400 ft..80 "	30 "
Opbir.....	1,200 ft..60 "	15 "
Roberts.....	1,200 ft..700 "	1,000 "
Potter.....	1,200 ft..700 "	1,000 "
R. E. Lee.....	1,200 ft..100 "	50 "
Jefferson.....	1,200 ft..00 "	20 "
Washington.....	1,000 ft..200 "	40 "
Red Cloud.....	1,600 ft..100 "	60 "
Yokohama.....	1,200 ft..20 "	4 "
Tycoon.....	1,000 ft..30 "	10 "

The above-mentioned claims were subsequently incorporated in the New Mexico mining company with a capital of thirty million dollars, divided into shares of one hundred dollars each. The trustees are G. D. Roberts, S. Heydenfeldt, J. D. Fry, Alpheus Bull and G. W. Beaver.

The above facts we present to our read-

ers as authoritatively given by those who have been to the mines, and whose reports certainly agree with one another. According to these there seems to be a good prospect of having a flourishing camp built up rapidly at this place. With the immense bodies of ore lying above the surface, and demanding, for the present at least, no expensive machinery,—almost none at all, in fact,—with a country around whence supplies can be drawn at no very exorbitant prices; with ore that runs very fair on the average, and very high at times, according to a large number of assays that have been made; with the prospects of having a continental railroad running directly through the town; with all these and other considerations in view, and without underrating the disadvantages of the location, we may be justified in expecting some big results from this new locality.

Orange and Nut Culture on a Large Scale.

A company of Chicago capitalists have associated themselves together with the view of entering upon the cultivation of oranges and nuts, in this State, upon a large scale. A gentleman arrived in this city two or three weeks since, to select a proper location and make the necessary purchase of land, etc., for the enterprise.

He is now on a trip to the southern part of the State for that purpose. It is the intention of the company to purchase several thousand acres of land, which will be put in condition, and covered with trees as rapidly as practicable. Oranges and English walnuts will form the chief articles of product, although other fruits, grapes, etc., will be cultivated to some extent. It is the intention of the company to utilize the land for wheat and other crops, until the trees come into bearing, so as to require the full power of the soil.

The company will depend chiefly on the East for a market for their oranges and nuts; as they expect by the time their plantation comes into anything like full bearing, the competition between rival overland railroads will so reduce freights as to enable this State to ship those products across the continent at rates which will allow of their general introduction into all the States upon, and to the west of the Mississippi river, and perhaps to markets still further East. We look upon this as the forerunner of many such enterprises, which will ere long be set on foot here by Eastern capitalists. There are but few who have any just conception of the importance which fruit growing on this coast will attain by the close of the next decade. California will ere long become not only the granary, but the garden of the great central portion of the American continent.

IMPROVED POTTERY WARE.—Mr. Daniel Brannan, of the San Antonio Pioneer Pottery, at Brooklyn, has lately received a machine invented by Merrill & McMillen, of Ohio, the first one ever on this coast for pressing and turning all sorts of pottery ware. He is now making a lot of milk pans and cream and butter pots of handsome pattern and superior strength and lightness. The machine is of very simple construction, and is run by steam power. It will turn out 1,200 pots per day with one man's labor. The outside mould of the machine is stationary, but the inside plunger revolves rapidly as it presses the clay into shape, producing ware of great tenacity. Mr. Brannan has been in the pottery business, where he now is, for 15 years. He does a good business in his line, and with his improved machinery, will no doubt be fully able to supply this market with the very best class of ware. He is now finishing up a set of pattern diss for flower pots, of convenient shape and elegant design. His worthy enterprise deserves success.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes from Idaho Territory.

[Concluded from last week.]

Quartz Mines on Grimes Creek.

Twelve miles east from Centerville, on Grimes creek, is the lode of the Mammoth G. M. Co., located in 1863. The average width of the lode is about two feet. The vein matter contains free gold and sulphurets and the ore generally averages \$50 per ton; I find that last summer there were 200 tons crushed which yielded \$90 to the ton. There is a shaft sunk 160 feet on the ledge, and a tunnel some 300 feet long which strikes the vein at a distance of 150 feet. The company has an 8-stamp mill, run by water-power, built in 1865, which cost some \$8,000. The mine has paid all expenses. The owners are Clarkson & Brown, old pioneers of this district.

Four miles further up the creek is the King company's ledge. This vein is small but very rich and with well-defined walls. There is an 8-stamp steam mill here, but I understand that not much work is being done at present. Want of time prevented my visiting this place.

Quartz on Granite Creek.

When in this section I had the pleasure of being introduced to Mr. Thomas Mootrey, Jr., an "old forty-niner" of San Francisco, a pioneer of this camp, and one of the most kind and hospitable as well as enterprising of men. Through his kindness I was able to visit the Gold Hill mine and mill, situated on Granite creek, about three miles from Placerville. The ledge runs northeast and southwest, has an easterly dip and crops out boldly for over half a mile. The average width is three feet. The company has been vigorously at work for years and has one 80-foot, one 120-foot and one 100-foot shaft, and three very large tunnels, all on the ledge. We entered first the lower level or tunnel, passing along 450 feet to where the ledge was tapped. We then went in the left drift on the lode, a distance of 80 feet, and here found the ledge about three feet wide and heavily charged with sulphurets and free gold. Returning to the tunnel we find another drift, some eighty feet long, on the ledge. At the entrance of the tunnel is the mill, which is therefore very conveniently situated with regard to the mine. When winter sets in the company will drive a shaft up to the second level and eventually bring all the ore out through the lower tunnel. At present the ore is lowered down an incline from the second tunnel. This incline is some 400 feet long and is 350 feet further up the creek. On it a 1-inch wire rope (manufactured by your well-known firm of Hallidie & Co.) is used, and the loaded car going down hauls up the empty car. At this mine are employed some 30 miners who are paid \$75 (currency) and found.

On both sides of the creek we find a granite formation, in which are the veins of quartz holding gold with silver and sulphurets; the gold predominating. The ore resembles somewhat that of Grass Valley. There were no sulphurets on top, those being first reached at a depth of 60 to 75 feet. The Superintendent of the mine is Mr. David Coughanour, a very clever and enterprising gentleman. The mine has paid expenses of all kinds.

The mill was erected by the Chickahominy company at an early day, at a cost of \$75,000; but the present company bought it at a low price not long ago. It has 25 stamps of 850 pounds each. To each four stamps there is a Hangerford concentrator, which does very well, I am informed, and gives satisfaction. A Hendy concentrator, also, four large Wheeler pans and two large settlers are used. The engine is of 75-horsepower, with cylinder 36x14 inches, and was built by the Miners' Foundry of San Francisco; the two large boilers were made by the Coffee & Risdon works. Three and a half cords of wood, costing \$4 per cord, are burnt daily. Twenty stamps were in operation at the time of my visit, but the other five were soon to be set at work. Some 35 tons are now put through in 24 hours. A clean-up, while I was there, of 9½ days run, gave 55 pounds of amalgam which yielded \$6,000. On account of the sulphurets only about one-half of the gold is extracted from the ore. The company has now on hand some 300 tons of sulphurets, and they are taking steps with regard to introducing Kustel's process for working these.

The mill is owned by Thomas Mootrey, Jr., Wm. Lynch, David Coughanour, Wm. Maloney and Avery Johnson. At their last annual meeting Wm. Lynch was elected President; William A. Coughanour, Secretary and Treasurer; and Thomas Mootrey, Jr., J. D. Coughanour and Wm. Lynch, Trustees.

The western extension of the Gold Hill mine is owned by Chandler & Co., who have a tunnel in some 40 feet on the ledge. The vein is from one to three feet wide and contains good ore, giving upwards of \$30 per ton in the mill.

The Eastern Extension, popularly called the

Growl and Go ledge, is owned by M. and J. Eisler. The shaft is down about 35 feet, being all the way in decomposed matter, the sulphurets not being yet reached. The company talk of erecting a 10-stamp mill near that of the Gold Hill.

The Yellow Jacket mine, located half a mile up the creek, is owned by C. P. Emery, G. White, J. Dixon and others. The lode runs northeast and southwest, and averages two feet in width. The tunnel is in 170 feet. The rock contains principally free gold, but they expect to find sulphurets as they go deeper. The 10-stamp mill is now being built and will be running in a few weeks.

The May Flower mine is a fine looking location owned by Turner & Young. The vein runs northeast and southwest and averages three feet in width. There is a tunnel 250 feet long; also, a shaft 90 feet deep. The boys have been working three years and doing well and it would pay to have a mill here, if the owners of the mine were able to build it. They have been working their ore successfully for three years with an arrastra. The apparatus for revolving the stones is quite unique, being a horizontal hardy-gurdy wheel, 24 feet in diameter.

Besides these mines there are several others, as the Gray Eagle, Columbia, Wob-Foot, Lnwyer, Pioneer, Golden Gate, etc., which I was unable to visit. One fact particularly struck me here, and that was the abundance of timber close to the mines.

Loon Creek Mines.

I met a gentleman, from the new mines discovered last year, who informs me that, at the Loon creek mines, situated about 125 miles northeast of Idaho City, there are some 200 men at work. Pay has been found for about four miles up and down the creek, which is a tributary of the Middle Salmon river. At present the miners are "going it slow," waiting for the water to lower, for the creek has had three distinct rises, each sufficient to stop operations. The gold obtained is of fine quality and worth upwards of \$17 to the ounce. I have seen several pack-trains going over to these mines.

Stage Lines—Remarks.

The stage line to take, in visiting this region, is that of the Pinkham Brothers, which runs from Boise City to all parts of the Basin, carrying the mail and Wells, Fargo & Co's express. I met the proprietors who are well-known as energetic business men and most hospitable acquaintances. After traveling by their line I am prepared to recommend it, as it was recommended to me by most of the boys. There is another line just started by Greathouse & Brothers. [We understand that the latter firm has since bought out the Pinkham Brothers.—Eds.]

I see that in the creeks here there is any amount of tailings, and I believe that a well managed company could make a big thing out of it, if they worked these, as they must contain a large amount of precious metal.

St. Louis seems to be hiding for the business of this section, and St. Louis advertisements are to be found in the hotels.

The use of gold dust in the Basin, as a medium of exchange, strikes the visitor as very queer, and strongly reminds one of the "old days." Dust and greenbacks are used, but no coin. Every saloon and store-keeper has his scales in which to weigh out his receipts. I don't like this plan; I'm not sufficiently accustomed to it, and although fairly generous, don't like to make gratuitous gold deposits every time I buy an article, as is unavoidable. Most of the dust is rated at \$16 per ounce. In Placerville and Granite creek it varies from \$16 to \$18, and in Idaho from \$14 to \$16.

W. H. M.

Boise City, June 30, 1870.

DISCOVERY OF ANCIENT MINES IN ENGLAND.—Near the town of Brandon, in the valley of the Ouse, is a large number of pits, commonly known as "Grimes Graves," which have been lately shown to be shafts of extensive underground flint mines, according to the *Colliery Guardian*. These are upwards of 200 in number and are about 25 feet apart. The shafts having settled and filled up, presented the appearance of bowl-shaped depressions, which had been variously regarded as graves, villages, etc. Below them was a stratum of pure flint, to obtain which, galleries were run in all directions. Picks were used, made of the antlers of red deer, of a larger species than are now existing in Scotland. The bunn ends of the horns were used also for hammers. One only stone hammer, of basalt, was found. No pottery was discovered. Nearly all the mining implements were made from the shed horns of the red-deer, and, with one exception, from the harr end. The people who fabricated this flint implements seemed to have lived on the spot. The Rev. Canon Greenwell, of Durham, is the investigator and discoverer of these interesting mines.

EXCURSION PARTY.—Last week Profs. Jos. Le Conte and F. Soule, with a number of students of the University of California, started on an excursion for the Yosemite.

*Mechanical Progress.***Sir Wm. Thompson's Syphon Recorder.**

This is equally delicate with the inventor's mirror galvanometer, while it is not, like that, subject to any error in reading. It was exhibited for the first time in England at an entertainment recently given in London by the Chairman of the British India Submarine Telegraph Co. The London Times says of it: "This remarkable instrument writes down in ordinary ink every fluctuation of the electric current received at the end of a submarine cable, and is likely to displace everywhere the mirror galvanometer. The older instrument shows every change by the waving backward and forward on a little spot of light, leaving no trace of its motions. It is almost incredible that men should acquire the skill required to disentangle at the moment the complex motions of this little spot, distinguishing the effects of earth currents, old signals, induction, and what not from the true signal; even with the greatest skill many repetitions are required, and uncertainty often hangs on the interpretation of a word. The new instrument indicates everything without any sacrifice in sensitiveness. A very fine class syphon waves to and fro over a running strip of paper without touching it, and from this syphon, ink is spurted on to the paper in a fine continuous line. The syphon follows faithfully the rise and fall of the received current, and these alternations are arranged so as to form an alphabet."

HEATING STONE-WARE VESSELS.—For many operations it is necessary to heat vessels of stone-ware to a high temperature. A naked fire will cause breakage, and an interposed sand-bath is more or less objectionable. A new method of applying heat, by which a temperature up to 700° Fah. can be obtained, is described by the *Chemical News*: Heavy paraffine oil is caused to circulate through a coil of pipes in a furnace, and then into an air-tight tank, from which it passes, through pipes, to the jackets of the stone-ware pans, returning, after it has done its work, to the lowest part of the furnace coil. A continuous circulation is thus kept up. After leaving the tank, the oil passes through a pyrometer, by which its temperature is indicated, and, by means of dampers, this can be regulated to any required point. The heating medium is turned on or off the jackets by taps, in the same manner as steam. In the model, fitted up to illustrate the method, the pyrometer indicates from 600° to 700° Fah., while a saturated solution of chloride of calcium is maintained at the boiling point in a shallow stone-ware pan. No smell of oil is perceptible in the room; and it is stated that the same oil may be used for years. As contrasted with steam-heat, the inventor claims a saving of 30 per cent. in fuel. The stone-ware used is manufactured expressly to insure its being impervious to the oil.

THOMSON'S ROAD STEAMER.—We find the following among the Glasgow notes, in *Engineering*, of July 1st: "During last week experiments were continued for several days with a view of testing the capabilities of Thomson's traction engine along one of the four-furrow ploughs made by Gray, of Uddingstone. The plough is to be used along with one of these traction engines in ploughing re-claimed land in California. The engine is one of eight horse-power, made by Tennant & Co., and cost £650. Ease and regularity were noticeable in the working of the engine. The facility with which it was turned—the wheels leaving scarcely a mark upon the ground—was sufficient to show that it might be available for cultivating any land that could be worked by horses. In the opinion of practical farmers present the work was well done. The plough worked at about double the usual rate of horses ploughing."

RUBBER SPRINGS FOR LOCKS.—The Birmingham correspondent of the *Engineer* says that a Mr. Wilson has taken out a patent for a lock in which he "proposes to substitute a strong ring of vulcanized India rubber as a spring, in place of the usual steel coil, or double feather spring. He thinks such a spring will insure greater uniformity of pressure upon the slides, besides being more durable than the metal spring."

CIRCULATOR ATTACHMENT FOR BOILERS.

A new apparatus, the object of which is to protect the boiler proper against intense heat, and present to the direct action of the fire a thin layer of water in continuous circulation, is described. It is a semi-cylindrical as long as the boiler, and placed under it, with its convex surface upwards. It consists of two sheets of metal kept apart by longitudinal bars alternately short at the ends, which guide the current of water in its zig zag circulation. The water is conducted by two large tubes, one on each side of the boiler, from its lowest point to the lowest point of the circulator. Being there exposed to the heat, it finds its way to the top, and through a tube into the boiler again near the water line. The steam ascends, and the water descends again through the two large tubes aforesaid, to repeat its revolution.

CARR'S DISINTEGRATOR.—A model of this machine was exhibited at the late meeting of the Institution of Civil Engineers in London. The *Engineer* says: "It consists of four cylindrical iron cages, formed of bars with open spaces between them, arranged concentrically, and rotated with extreme rapidity, in contrary directions to one another, by means of an open and a crossed strap. The first and third cages rotate to the right, the second and fourth to the left. The material is thrown in at the central orifice, and after the lumps are broken by a stationary knife, thrown out by centrifugal force from the first cage at a tangent, and at a speed of from 50 to 80 feet per second. Meeting the beaters of the next cage, a fresh impulse is given in an opposite direction, to meet the beaters of the third cage traveling the reverse way, and so on in like manner with the fourth. If the material is of a friable nature, it is shattered by these successive blows into fine powder, and delivered in a radiating shower from every portion of the periphery, and then arrested by the external casing."

ENAMELING IRON.—A recent English improvement is given in the *Iron Age*: Upon the surface of the plate of the metal to be enameled is laid a uniform ground, of any color required to produce the intended design, as, for instance, a name-plate, or tablet, with the ground white and the inscription blue. The white ground having been fused on in the melting furnace and allowed to cool, there is then applied with a brush evenly over the whole surface a coating of blue enamel, the materials of which are finely levigated and mixed with gum-arabic and water, or other mucilage. When dry, a stencil of the inscription is laid on, and the enamel paste is removed from the parts which are unprotected by the stencil, by the application of a stiff brush leaving the ground clean, except the letters. The plate is then again subjected to heat, whereby the paste, which is fusible at a lower temperature than the ground previously laid, becomes permanently fixed upon it.

IRON WORKS AT ST. LOUIS.—The *Republican* describes the Vulcan Works now building. We quote: "There are to be fifty-four furnaces—heating and puddling—three large engines with fly-wheels weighing 90,000 pounds each, beside six other engines of different sizes, to suit the work to be performed by each. The rolls are to be twenty-two feet in diameter, which will enable the company to make steel rails when it is deemed advisable. The whole is to have a capacity for turning out one hundred tons of new rails per day, on what is termed a single turn, or about one hundred and seventy-five tons on a double turn (night and day). We expect to see the mill in operation by 1st of next January, and giving employment to fully 300 persons."

COST OF GAS AND COAL PER HORSE-POWER.—In an article upon this point with reference to Mr. Goddard's paper recently read before the British Association of Gas Managers, the *Scientific American* says: "We have but to take the statements of Mr. Goddard to verify our opinions as to the cost of the application. He gives as the average consumption of gas per horse-power per hour, in the boiler described, 100 cubic feet. This in New York would cost for one horse-power per day of ten hours exactly \$3.50. Allowing ten pounds per horse-power per hour of coal, with coal at eight dollars per ton, the same power would cost, if coal were used to produce it, only forty cents."

Scientific Progress.

THE GREAT BASIN.—"At the close of the Cretaceous period," writes Prof. Hayden, "the ocean which had rolled uninterruptedly across the area now occupied by the Rocky Mountains began to grow shallow, until at last a long barrier of land gradually rose above the waves, and separated the Atlantic from the Pacific. This elevatory movement culminated in the Rocky Mountains range in the United States, and probably has been going on from the Cretaceous period down to the present day. In the early Tertiary epoch enormous lakes occupied the basin of the Mississippi. The 'great lignite basin,' for instance, extends far southward, possibly even to California, westward far over the mountains to Utah, and possibly to the Pacific, and northward probably to the Arctic sea, interrupted here and there by the upheaval of mountain ranges. The strata which testify to the former existence of this great lake, consist of layers of clay and sand, and numerous beds of lignite, varying in thickness from a few inches to twelve or fifteen feet. In its lower portion an oyster is the characteristic fossil, which by its stunted growth implies a change from salt to brackish water, while in the rest of the formation there are freshwater shells of the genera *Melania* and *Corbicula*. The occurrence of immense fan palms, and many other plants now growing only in tropical climates, points directly to the conclusion that along the shores of this great lake there grew most luxuriant forests, equalled only by those now existing in Central America or Brazil." The date of this lignite formation is possibly Eocene, and certainly pre-Miocene. Some of these lakes continued to exist as late as the Pliocene epoch."

PHOTOGRAPHED NERVE-SECTIONS.—*Nature* says that Dr. Duchenne, of Boulogne, has presented to the French Academy of Medicine an album containing copies of photographs of the appearances presented by sections of the great sympathetic nerve, the spinal ganglia, the spinal cord, and the medulla oblongata greatly magnified. He fixed the photographs on stone by a process he terms photo-autography, the details of which, however, he does not communicate. It is satisfactory to find him stating that the results confirm the substantial accuracy of the beautiful drawings made by Dr. Lockhart Clarke on the central parts of the nervous system, and especially upon the medulla oblongata. In his later experiments Dr. Duchenne has adopted Dr. Clarke's method of preparation with chromic acid and carmine. He states that certain micrographic details come out with wonderful clearness in the photographs, and that by this means some important additions may be made to our knowledge. He has ascertained that in the white substance of the medulla oblongata there are nerve tubules from thirty-three ten-thousandths of a millimetre to three-hundredths of a millimetre in diameter.

MORPHOTROPISM.—In a memoir communicated to the Prussian Academy by Dr. Groth, on the relation between crystalline form and chemical condition, the author remarked upon the failure hitherto experienced in all attempts to apply the theory of isomorphism to organic compounds, and stated that he adopted a new method of investigation, which consists in ascertaining the nature of the change produced in a given crystalline form by the access of a definite atom or atomic group replacing hydrogen. He describes a long series of experiments, which lead him to conclude that there are atoms and atomic groups, which, by substitution, alter the crystalline form of a body only in a certain direction. This change he proposes to call "morphotropism," and he indicates the different modes in which the "morphotropic forces" may be modified in action.

ASTRONOMICAL OBSERVATORY.—A new observatory has been established by the Government of the Argentine Republic in South America, to be erected at Cordova, about the middle of the continent, on the margin of the Pampas, in lat. 31½° S. Dr. B. A. Gould has been invited to organize it, and is going out for the special purpose of extending through the Southern Hemisphere the system of zones, which Bessel and Argelander have already carried from the north pole as far as 30° S. He hopes also to obtain some photometric determinations of the principal southern stars.

STRAW-WAX.—We find the following in *Chemical Excerpta* by Prof. Wurtz: "This was obtained by the investigator, B. Badziszewski, from a straw-paper factory. It is solid; white; greasy to the touch; soluble in caustic alkalis, even boiling; soluble in alcohol, especially when hot; soluble in ether and bisulphide of carbon. It crystallizes from alcohol, in nearly brilliant scales, which are greasy; melts at 108° F. to a colorless oil, which on cooling becomes hard and brittle. Boils without decomposition at 572° F., leaving but little residue. Has a strong odor of rotten straw, due probably to impurity. Bromine attacks it, but hot concentrated nitric acid with difficulty. Concentrated warm sulphuric acid dissolves it, from which solution water precipitates it apparently unaltered. It has some analogy with the sugar-cane-wax, which fuses, however, only at 180° F."

Prof. Wurtz adds: "This onerous class of waxes should receive much further examination. The indifference to alkalis might make this one very valuable. If of value, it should be readily, cheaply, and abundantly obtainable from straw by means of bisulphide of carbon. It does not appear that the author has given any analytical results."

ARGUMENT AGAINST DARWINISM.—In his annual address as President of the Canadian Institute, the Rev. William Hincks makes use of the following argument in opposition to the Darwinian theory of Natural Selection: "Nothing is to me more evident than that both seemingly permanent specific and higher differences, and varieties which have no pretensions to permanence, depend on the comparative development of different elements of a common plan; from which it seems to follow both that the non-existence from the commencement of living nature, of all the distinct plans of structure, is in the highest degree improbable, and that the tendency of development, sometimes in one direction, sometimes in another, among the same primitive elements, must produce a harmonious system; whilst the preservation of the forms best adapted to a situation amongst a great number of variations arising without order must produce a confused mass of objects having no regular relations and incapable of being reduced to a common system. Which of these prevails in nature I cannot for a moment hesitate in deciding, and consequently I must maintain that, if there is variation it must be within definite limits, and according to a fixed plan, so as to maintain a uniform order and harmony in the whole system."

MAGNUS ON HEAT RADIATION.—We take the following paragraph from the biographical sketch of Prof. Magnus by A. Oppenheim, in *Nature* for June 23d: "During the last years of his life the radiation of heat formed the chief object of his researches. A paper on the polarization of the dark rays of heat, the discovery of the diathermanous nature of native chloride of potassium, and lastly a full research on the emission, absorption, and reflection of heat radiated at low temperatures, were the results of this protracted and fertile investigation. He showed that heat from different sources is refracted under different angles, and absorbed in different proportions by the chlorides of sodium and of potassium, by fluor-spar and other substances. He thus proved, that, if our eyes were able to distinguish different rays of heat, we should see the different substances glowing in the most varied colors at ordinary temperatures, just as we see them emit different rays of light when exposed to heat and observed with the spectroscope."

THALLIUM.—At a meeting in Berlin of the Royal Prussian Academy of Sciences Prof. Rammelsberg read a paper on the position of thallium in the series of elementary bodies. He describes several salts of thallium, such as the iodates and periodates, the chlorides, bromides and iodides of thallium and their double salts, and referred to the isomorphism of the salts of thallium with those of potassium (rubidium and ammonium) as shown especially by the researches of Des Cloiseaux. He stated that although both physically and chemically thallium is a metal, it presents a combination of characters in its compounds which renders its precise location difficult.

The telegraphic extensions from India to China, Java and Australia, are being rapidly pushed forward by the English. This year, cables will be laid from Madras to Singapore, thence to Hongkong and Shanghai, and to Java and Australia.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE—NEW STRIKE.—*Miner*, July 16th: Last night's shift, in the east drift, struck through a clay casing into the well-defined lode, which is pronounced identical with the Hercules in the M. C. M. Co's shaft. This lode is 630 feet from the mouth of the tunnel.

Monitor No. 3 will probably spend work for a few days until air pipe can be put in. The gas in the tunnel is like that in the Schenectady just before the rich strike three years ago.

GOOD AVERAGE.—From the lot of rock sent by Mr. Hartshorn from the ridge between Alpine and Mono, Mr. Lewis has made four assays, and the average value is \$30.21 per ton.

AMADOR COUNTY.

CONY MINE.—*Ledger*, 22d: The task of erecting a blower is completed, and it has been found to operate to a charm. The work of sinking will be pushed vigorously from this time.

BUTTE COUNTY.

TAYLORVILLE.—*Cor. of Oroville Record*, July 23d: Most of the quartz mills in this vicinity are running and paying well, especially the Crescent and Indian Valley mill. I understand the owners of the latter expect to erect a new mill during the Fall.

CALAVERAS COUNTY.

UNION SHAFT.—*Chronicle*, July 23d: We learn that Peters, Champion & Co. have struck it. They have discovered a large amount of gravel that will pay from four to five dollars per day to the hand.

LOWER RICH GULCH.—The Palomo mill is running day and night, 36 stamps crushing the rock as fast as it can be taken out. There is no diminution in the richness of the quartz or signs of failure on the part of the lode. Alexander & Co. are getting along finely. Their new shaft is sunk 200 feet. Several levels are being run and the rock averages well. Their 10-stamp battery has not stopped during the past two years except for repairs.

RAILROAD FLAT.—The Burr mill is constantly in operation crushing custom rock. The last worked was from the Poe mine, at Independence, which averaged \$18 per ton. The Lewis Bros. shaft has reached the depth of 160 feet. Lefoy & Co. renew operations Monday. A shaft 150 feet has been sunk, disclosing a lead three feet in width. The rock, so far, has paid handsomely. The Chapman mine is not worked. The volume of water cannot be overcome with the machinery. Capital is needed. The Cudell mine is also idle. It is understood that negotiations for its sale to Mr. Thoss, of West Point, are pending. There are rumors that the Petticoat mine is about to be sold for a large sum. Snoddermeyer & Co., of Independence, are taking out good rock and plenty of it. They have a lead three feet in width that will average \$25 per ton. A number of gravel claims are being worked with favorable results.

The Railroad Flat correspondent of same says: Mining prospects were never brighter. The custom mill of Mr. Burr is not only filled with rock, but tons upon tons outside await turn to be crushed. The rock from the Bald Eagle turned out well. The mill at present is upon a lot of a hundred and twenty tons of first quality rock, from the mine of Frank Barney, at Mosquito Gulch. The Mary Ann, a new discovery, by C. A. Cornell, shows a fine body of ore. It is rumored that W. V. Clark contemplates putting the Smart mill in repair, and starting it. We have abundance of ore to keep more stamps employed.

INYO COUNTY.

KEARSAROE MINE.—The Inyo *Independent* of July 16th, gives the history of this mine from the discovery in 1864. It has been since then at different times under the charge of six different managers. Since March last, W. M. Leet has been Superintendent, and considerable bullion has been shipped. There is now on dump 80 tons ore, worth \$100 per ton. Thirty men are employed in mine and mill. The ore now coming out is from the lower tunnel 300 feet from the surface, and averages \$60 per ton.

The *Independent* says the furnaces at Cerro Gordo and Swansea on Owens' Lake, ship over 200 tons bullion monthly, on the average. There are nine quartz mills and four furnaces in the county, besides about 20 arrastras. Most of the mills are idle. They were erected before the ores were understood. The Eclipse mine, 12 miles from

Independence, in the Inyo mountains, is being worked by an English company, which is now putting up expensive machinery.

CERRO GORDO.—*Cor. of same*: The works of Belshaw & Elder consist of two reverberatory slagging furnaces, two blast furnaces, crusher, an improved Root blower, and a 6-horse engine and boiler. C. F. Hahn, while making a cut to the series of ledges discovered by him in 1869, discovered another which he named the Wittekind. It is now considered one of the best in camp. The Cumberland is still richer, though smaller. Work progresses upon both, and they grow richer as they descend.

KERN COUNTY.

HAVILAH.—*Cor. of Visalia Delta*, July 20th: The Big Blue lode is being worked 100 feet in width, and although the ore is of rather low grade, by the aid of heavy machinery can be made to pay. Other ledges belonging to the same Co. are small, but of higher grade. One has been kept going, and another will be started in a week or ten days. At Sageland, Bridger & Co. have made a successful run, and are now re-opening the mine. The gold is there, as has already been proved. The Esmeralda mill is standing idle for want of water. The Joe Walker mill, which has been standing still for more than a year, is expected to start up next week. They have not yet reached the lower level with the new shaft, but have gone sufficiently low to drain the next lowest. The new pump does the work with perfect ease. The Marsh & Kennedy mill is hammering out the gold for all who produce the ore. The mill has not been kept running more than one half the time, for want of rock, and yet there are a great number of mines unworked, which are known to be good. In the Washington district a party of practical miners are taking out excellent ore.

LOS ANGELES COUNTY.

BULLION.—We were yesterday shown 183 ounces of gold bullion, the product of the Eureka mine, Soledad district.

MARIPOSA COUNTY.

RICH STRIKE.—*Gazette*, 22d: Carr & Wark struck an exceedingly rich pocket in their quartz mine near Hornitos, week before last, from which they took in four days 122 ounces of gold. They have been working this vein about eight months, and this is the first return they have received.

It is reported at Hornitos that Robinson & Co., of San Francisco, will soon resume operations in the Oaks & Reese mine, Hunter's valley.

NEVADA COUNTY.

MEADOW LAKE.—*Transcript*, 21st: We learn that there is considerable activity in that locality. Old residents, who left discouraged three or four years ago, are returning. Price & Co. are running their mill regularly, crushing rock from various ledges, and the prospect is fair for the development of a number of good mines.

WATER.—*Same of 23d*: The supply of water in the ditches of the South Yuba Co. has fallen off rapidly. In some claims they have suspended piping, and others will close in a day or two. The water in the lakes is nearly exhausted, and after this week only 500 inches will be run to this section, which will merely afford sufficient for cleaning up.

O'CONNOR MINE.—*Grass Valley Union*, 21st: The Grass Valley Consolidated mine, better known as the O'Connor, is yielding splendid rock. We were shown, by Dan Collins, yesterday, a beautiful specimen containing leaf gold all through it. It was taken out 80 feet below the surface, in the shaft.

EUREKA.—While the mine was making regular runs of \$2,000 per day, we did not care to notice the fact. Since our report a month ago, the yield has not fallen under those figures. On Tuesday last the semi-monthly melting occurred. Eleven days' run of the mill gives \$30,000, not including sulphurets.

GRANITEVILLE.—*Cor. of Gazette*, 20th: The Star mill commenced crushing on the 14th. Robinson and Pendleton, the contractors, have 300 tons of rock at the mill. I think it will pay \$15 per ton. The Mountain Queen ledge is four feet thick at the bottom of the shaft, which is 30 feet deep. The Dower & Cady Co. erected a six-stamp water mill on their claim last winter. After crushing 50 tons, their water gave out. The Jim mine is worked constantly with twenty men. The rock looks well 300 feet from the surface. The Bruchville Co. are erecting hoisting works and will be ready to commence operations in three weeks. They work 12 men. The Banbury ledge, Black & Irwin, is four feet wide. They are taking out fine looking rock 300 feet from the surface. Their 10-

stamp mill is running day and night.

PENNSYLVANIA MINE.—*Transcript*, 26th: The mine has been pumped out and cleared, and Helm commenced yesterday to take out rock. The incline and tunnels were found in first-rate order.

STAR MINE.—We were shown a letter yesterday from Pendleton, in which he states that the mill is running night and day. At present they are crushing rock from the Orleans. The vein in the Star ledge is two and a half feet in width, the rock being mostly decomposed.

BANNER.—Mr. Tisdale, Supt., has shown us a six-ounce gold bar from one ton banner ore by chlorination. The same by mill process yielded \$20 per ton.

PLACER COUNTY.

MORE WATER.—*Herald*, 21st: G. W. Reemer, owner of the Auburn and Bear River Ditch, has purchased the old North Fork Ditch, which has been lying idle since the dam was swept away by the flood of 1862. Mr. R. commenced the construction of a new dam this week at old Tamaroo Bar, and expects to have the water in the ditch before the rainy season sets in.

COLFAX.—*Cor. of same*: The Rising Sun still works her usual quota of men, and keeps pounding away. The Montana contracted for machinery last week to pump, hoist, and run ten stamps, together with all necessary apparatus for a first-class quartz mill. They commence operations next week.

GOLD RUN.—*Stars and Stripes*, 21st: At the old Indian Hill claims on Canon creek, seventy-five inches of water acting on a little hurdy-gurdy wheel, furnishes the power for a mill; which crushes thirty-five tons of cement every twenty-four hours. The tunnel is in over one hundred feet and the company have breasted three hundred feet from the end of the tunnel with satisfactory results.

THE MALLET MINE.—The shaft is 125 feet deep through milling rock of high grade. The ledge has been stripped 230 feet. Free gold is visible almost everywhere. Wm. Green, now owner and manager, is about putting up a mill.

RATLESNAKE.—*Cor. of same*: Martin & Co., at Pilot Hill, struck some rich rock a while ago, above the old Boulder claim. They took five hundred dollars from one pocket.

SAN BERNARDINO COUNTY.

THE GREEN LEAD.—*Guardian*, 16th: Geo. Moore, owner, returned a few days ago from the mine, bringing large chunks of amalgam, the result of four tons of rock. The ore produced \$56 per ton. He is running two arrastras, but intends to erect a large water wheel for milling his rock by machinery.

MORE DISCOVERIES.—We were shown specimens of rich silver ore from a lead just discovered, 30 miles from San Bernardino, this side of Holcomb Valley.

SIERRA COUNTY.

IOWA CO.—*Messenger*, 23d: This company, near Mt. Pleasant Ranch, have sunk their shaft to the bedrock, and will commence a tunnel.

CLEANED UP.—Wilbourn & Co. have suspended operations near Gold Lake, and cleaned up, as water has failed. Prospects for next season are good. They had just reached pay. One specimen worth over \$40 was found. The claims in that section have paid well this season.

ENGINE.—The Nevada Co. at Whisky. have put a steam engine in their claims to pump and hoist. The machinery is 1,200 feet under the mountain, a shaft having been raised for the smoke stack.

Arizona.

THE PROSPECTS.—*Prescott Miner*, July 9th: Mining industry was never more prosperous; the mills now running are paying well; many new and rich mines have been found.

ANOTHER DISCOVERY.—McCrackin, Fine, Taylor and Hogle arrived in Prescott yesterday, from the Bradshaw District, 30 miles south, with a lot of the richest gold-bearing quartz we have ever seen, from a ledge recently discovered on the summit of the Bradshaw. The ore is decomposed, and yields about \$1 to the pound. The ledge is a "blind" one, and the pay streak from thirty inches to three feet in width. The country is well watered, timbered, grassed, and filled with game.

CAMP DATE CREEK.—The ore now being taken out of the recently discovered mines in Martinez District, is surpassingly rich; new veins are being discovered, and people are arriving from every direction. Gen. Cogswell, Col. O'Beirne, Lieut. Chuley, U. S. A., Gov. Safford, and Mr. Wasson, correspondent of the *San Francisco Bulletin*, have visited them. We have Mayflower

ore, which will go \$2,000 to the ton. There is plenty of wood and water, and machinery will soon be erected.

WICKENBURG.—*Cor. of same*: The Vulture mine is looking better than for two years. There is four years ore in sight. The vein matter at the bottom of the main shaft, is 7½ feet wide with 4 feet of concentrated pay ore on the eastern side. They are to sink another hundred feet in the main shaft. This, with the levels that will be run, will make the Vulture the best of the great mines. The mill is running steadily. Last week they took out two of the old mortars and replaced them with new ones, and now the whole 40 stamps are producing as fine results at as any time during the past two years. The ore from the White Picocho resembles that from the Burro mines. A piece of ore weighing six ounces, from a late discovery three miles east of the Vulture mill, gave \$1.70 in gold.

Colorado.

ITEMS.—*Central City Register*, July 20th: The Consolidated Gregory mine, nearly drowned out, is nevertheless paying more than at any time. During May, the net earnings were \$1,200, and in June \$2,200. July will equal June.... W. B. Rockwell showed a bar of gold from the Chlorination Works. It weighs 85 ounces, and would coin \$20 per ounce. This is the last of a half dozen of the same size, within six weeks.... Discovery shaft in the Cariboo mine, Grand Island district, is 75 feet deep, and shows three feet of ore carrying \$210 ounces of silver per ton. Twenty tons have been sold to Prof. Hill for \$3,000. It was of high and low grade.

LAKE COUNTY.—*Cor. of same*: The gulches are all running abundant water. Lost claims are paying well. At Cache creek, the Gaff Co. are doing well, also Snyder & Co. At Granite, the Yankee Blade mill is running steadily. At California Gulch, the Printer Boy, owned by J. Marshall Paul is paying well. Three men puddling this soft material, have been taking out fifty to a hundred ounces of gold per week. The Five-Twenty, and the Pilot, are yielding excellent returns. Two companies are working the Lincoln lode.

ITEMS.—*Herald*, 20th: In the Wamach and Seaton mine a large body of fine ore has been found. The ore vein in the Brown mine, Clear creek, shows the largest body of rich silver ore to be found in the Territory.

SNAKE RIVER (COLORADO).—John Lynch, at Montezuma, started up his new works on Monday on ore from the Shenango tunnel. The pay ore is four feet wide, and assays 150 ounces per ton. James Gallery, in the Simmons, has two feet of \$190 ore. The St. Lawrence Co's works will not start before September 1st: The Boston Co's smelting works, above Montezuma, started up on Monday.

GEORGETOWN.—*Miner*, July 14th: Good mineral has been struck in the Cliff, Democrat mountain.... The bar miners, below Idaho, are sluicing out large quantities of gold dust.... The German Reduction Works send out a brick this week weighing 979.60 ounces, coin value, \$1,186.76.

Forty miners are at work on the Seaton, Idaho district. This mine is turning out large quantities of rich ore.... The Baker Co. shipped this week two bricks, one weighing 790 ounces, coin value, \$794.64, and another weighing 845 ounces, coin value, \$769.12.... The first shipment of Terrible ore, ten tons, to Swansea, England, yielded, by assay, 537 ounces in silver per ton.... Connection between the Marshall tunnel and the Equator drift was consummated to-day, making an underground opening of 1,200 feet. The shaft in the William Ferry is down 50 feet. Twenty-five pounds of the ore yielded at the rate of \$503 per ton.... The pay vein in the James Guthrie is three feet thick.... The Wyoming Co. are driving a tunnel to cut the Ni-Wot lode. The tunnel is six feet wide, by six and a half high, and will be 155 feet in length. Fifty-five feet have been driven. Thirty feet from the entrance the Lebanon lode was cut, disclosing a two and a half foot crevice, with three inches of pay.

Idaho.

FLINT DISTRICT.—*Boise City News*, July 20th: Messrs. King, Hood & Pritchard, worked 15 tons of ore from the Pioneer lode, which produced 3,407 ounces of silver bullion, assaying \$3,433.09. The company has leased Black's mill and intend running the ore through it as fast as it can be taken out.

ALTURAS COUNTY.—Hon. S. B. Dilley, thinks quartz interests are looking up. It is understood that parties who went east, have disposed of several of the largest mines to heavy capitalists.

ITEMS.—*Avalanche*, 16th: Golden Chariot is said to be yielding better than

ever...The McMahon Bros. have commenced work in the Red Mountain mine. Work is progressing rapidly on the Peck & Porter shaft. Only fifteen feet is required to make the connection with the Mahogany...The Empire drift is in between 40 or 50 feet north from the bottom of the shaft, which is 80 feet deep...The Ida Elmore continues to furnish ore enough to keep the mill in constant operation...The proprietors of the Amador mine, Long Gulch, are ground-eluting off the surface...A drift is being run south from the bottom of the shaft of the Morning Star extension. The ledge is 20 inches in width, and yields fine looking ore...Hay & Co., on the Skookum, will work the ore in their new arastra, when completed...Jule thinks he will soon have enough rich ore out of the Chipmunk for a home stake...The Poorman yields 100 tons of ore per week.

IREMS.—Same of 23d: The Cosmos mill has started up on Empire ore...Fred. Warnke and Jimmy Brown brought over 2,000 ounces of bullion from Flint this week...Splendid looking ore continue to be taken from the South Extension of the Morning Star...Twenty tons of Skookum ore at Trask's arastra, yielded well...The Red Mountain shows a ledge ten inches in width...Jones & McMahon are taking good looking ore from the old etopes of the Silver Cord...The Chipmunk shaft is down 25 feet. It is rich in gold and shows more oilver.

LOON CREEK.—Oro Grando Cor. of same: Work is now going on up and down the creek for five or six miles, and considerable money taken out. One day last week in sinking the hole to set a pump in Forrester's ground, they panned out over \$500—\$42.75 in one pan. All the men are being employed that can possibly be crowded into the claims. There are more men in camp than can get employment.

The *World's* correspondent, 21st, says: The upper flume company commenced operations Thursday. They, Gaunt, Lundy & Co. have in 300 feet of flume; Forrester & Co. have about the same next below. They yesterday got \$40 in one pan of dirt from the bedrock. The lower flume is 1,025 feet in length, and was laid in one by three distinct companies, Adams & Kinley, 400 feet; Mayfield & Co., 200 feet; Challis, Murray & Co., 425 feet. The water was turned into the flume yesterday.

Nevada.

COPE DISTRICT.

IREMS.—Elko *Chronicle*, July 24th: The Argenta Co. have 200 tons ore on dump; are working eighteen men, and will commence milling again in a few days...Excellior has a few men at work; body of quartz in one place five feet wide...Crescent shaft is down 218 feet, on an angle of 40 degrees; they have had 234 tons of rock milled with satisfactory results. The average width of the ledge is three and one-half feet.

Kneisley & Co have struck a galena ledge at Bull Run that assays \$155 in silver.

ESMERALDA.

AURORA.—Cor. *Inyo Independent*, July 16th: Aurora is not dead yet. The Wide West mill will be started up in a week or ten days. The old Esmeralda and Antelope claims are being reopened, and miners are getting out ore. It is thought that these two mines, with the small force at work, will keep ten stamps running. Other mines are being opened.

HUMBOLDT.

ARIZONA LEDGE.—*Silver State*, July 22d: The Silver Co. have made another rich strike, and have put on an extra force. Fall & Temple's mine is looking brighter than ever. Both are rushing ore down to their mills at the rate of fifty to sixty tons per day.

RELIEF DISTRICT.—The Central Pacific mine, Miller & Co., bids fair to become one of the finest. The ledge is enormous, and they are getting a large quantity of pay ore. Another lot of selected ore will be shipped to the Auburn Mills, Reno, in a few days.

REESE RIVER.

The *Reveille*, of July 23d, says: The Manhattan mill has made a good start and is doing capital work. The value of the ore around Austin now waiting reduction is estimated at \$400,000.

BELMONT.—Cor. of same: Never has the prospect been so bright. The El Dorado mine is taking out ore from a level 240 feet deep, which will yield \$200 per ton. They yesterday, with one blast, took out a thousand pounds which, in my judgment, will go \$4,000 per ton.

The Canfield mine are being worked with thirty-five men, and through the entire extent, from thirty to eighty feet deep,

the ledges is from two to four feet thick. The ore pays from \$100 to \$200 per ton. Mr. Canfield has been running the old Buel 10-stamp mill for a month and a half, and has shipped over \$25,000 worth of bullion.

The Arizona incline is down eighty feet on a ledge of three feet, paying from \$200 to \$500 per ton. They have much ore sacked for mill.

The Combination mine and mill are standing idle. The reason is best known to the Company.

TELEGRAM.—Austin, July 26th: The Manhattan Co., have shipped, in the last four days, to New York, seventeen bars of bullion, valued at \$25,526.

WASHOE.

YELLOW JACKET.—*Gold Hill News*, July 23d: Daily yield 350 tons; 200 low grade ore from the upper level, and the balance high from the rich section between the 800 and 900-foot levels. Superintendent's annual report shows product of mine to be \$1,779,227.

OCCIDENTAL.—The old mine is yielding steadily, with more ore in eight than ever before. The lower tunnel is being thoroughly repaired.

SAVAGE.—Annual report shows product of mine to be about \$300,000.

HOPE.—Daily yield 40 tons, keeping both mills running. The ore averages \$25 per ton.

KENTUCK.—The yield has been slightly augmented by the development of a small streak of good ore four feet wide at the 80-foot level.

SACRAMENTO & MEREDITH.—The new mill is running at its full capacity on ore from the extensive ledge in the upper workings. **GOULD & CURRY.**—Daily yield 40 tons, assays averaging \$32. A new station is opened between the sixth and seventh.

OPHIR.—Drift No. 2 is pushed ahead with excellent promise. The mine is closed against outsiders.

HALE & NORCROSS.—Daily yield 240 tons, principally from the lowest level. The ore breasts look as well as ever.

CHOLLAR.—Daily yield 300 tons; average assays, \$62. The Belvidere section yields more abundantly, but the quality is not so good.

VIRGINIA CONSOLIDATED.—The drift at the 500-foot level of the new shaft is in 472 feet. Rock works favorably, and water less troublesome.

CROWN POINT.—Daily yield 50 tons, low-grade ore from the upper levels. The incline from the 1,000-foot level is down over 150 feet.

WHITE PINE.

REVIEW.—*News*, 24th: The transfer of leading properties, and resumption of operations thereon, has had the effect to re-establish confidence in the ultimate prosperity of the district. The initiatory steps for the re-establishment of refining and separating works, here and at Eureka, for the treatment of base bullion, contribute largely to the prospects of improved times.

BULLION.—Our exports of fine bullion during the week aggregate \$34,053.87, of which \$18,920.31 went West, and \$15,133.56 East.

ITEMS.—The forces on the Aurora Consolidated end Eberhardt, under the new management, are shortly to be increased. We learn that the erection of a 40-stamp mill, at Eberhardt City, has been decided upon...The Aurora South continues to maintain its reputation, and the shipments of treasure from the Stanford mill aggregate \$16,000 per week...The Silver Wave is yielding an abundance of high-grade ore. The Perkins shaft is down 53 feet—24 of which is in ore and vein matter. A fine body of ore struck in the Wheeler shaft, at a depth of 40 feet...Increasing activity about the Wabash and Hemlock.

...Captain Rogers is prosecuting work on the Noonday...Base metal mines are more sought after than any other. The Jennie A. Consolidated, Flannagan, Maggie Consolidated, and others are daily improving...Some high-grade ore was struck on Thursday in the Chempion mine, Pinto. It is the richest yet in that section. ...Piermont ore worked \$182 per ton without assorting...Some rich ore came in yesterday from a new district east of White Pine...Governor Matteson's furnace machinery has arrived at Elko, and may be expected here next week...But three furnaces are in operation—Rathburn's, Weiland's, and Walsh's. The White Pine will shortly fire up; the creditors having been settled with at 50 cents on the dollar. The Aleop is still waiting for returns from the bullion forwarded to Newark...Pritchard & Co. shipped 40 tons of coarse bullion for the week, and have 26,700 pounds from Wieland's furnaces to forward to-day.

A NEW PAPER.—We are glad to see that the second number of the *Inyo Independent*, lately started at Independence, Inyo County, fully sustains this favorable impression created by its first issue. We find such articles as that on Inyo County most interesting and instructive, and we rejoice that a good paper has been started in that section of the State.

WILLAMETTE UNIVERSITY.—The annual election on the 21st inst. resulted as follows: President, T. M. Gatch; Professor of Mathematics, L. J. Powell; and Rev. C. C. Stratton, Professor of Natural Sciences. The institution has an average attendance of over two hundred.

OCEAN RACE.—In the race across the ocean, the English yacht *Cambria* led the American *Danforth* one hour.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

BUCKEYE M. Co.—Ophir District, Placer Co., July 18. Capital stock, \$100,000, divided into 2,000 shares. Trustees: C. W. Kellogg, J. D. Fry, F. Jones, J. W. Gashwiler, Mark L. McDonald, J. T. Greenman, and G. D. Roberts.

OMIONAL AMADOR M. Co.—Amador County, July 18. Capital stock, \$1,200,000, divided into 12,000 shares. Trustees: Thomas Bell, Geo. Hearst, Charles Bonner, John H. Paull, and J. W. Gashwiler.

ANTI-COOLIE LAUNDRY ASSOCIATION.—Capital stock, \$50,000, divided into 10,000 shares. Trustees: J. M. DePass, M. V. Casey, John Whalen, T. Devine, and J. W. Erells.

EUREKA REDUCTION AND MINING WORKS.—Lander Co., Nevada. Capital stock, \$100,000, 1,000 shares of \$100 per share.

The following have been recorded in the Secretary of State's office, Sacramento:

COLE SPRING GRAVEL M. Co.—Nevada county, July 14. Capital stock, \$40,000, in 400 shares. Trustees: A. Isard, Ed. Muller, J. B. E. Cavallier, E. Derbec, I. J. Rolfe.

Meetings, Elections, Etc.

MOUNTAIN CITY M. Co.—Cope District, July 13. Trustees: Nathaniel Page, William H. Sharp, Stephen Otis, Isaac B. Davis and B. Frank Page.

WASHINGTON M. Co.—Mariposa Co., July 13. Trustees: Nathaniel Page, J. P. Dyer, J. B. Haggin, Thomas Bell and B. F. Tuttle.

OVERMAN M. Co.—July 14. Trustees: M. J. McDonald, A. Hemme, O. H. Bogart, L. Vesaria and George W. Cope.

MARKET STREET RAILWAY Co.—July 14. Directors: Charles Mayne, Peter Donahue, H. M. Newhall, Henry Barroilhet and James O'Neill.

YELLOW JACKET MINING Co.—July 18. Trustees: J. B. Winters, (President and Superintendent), William Shanon, F. G. Taylor, N. H. A. Ball and T. D. Storer. F. Foskison, Secretary; Bank of California, Treasurer.

PACIFIC POWDER MILL Co.—July 19.—Trustees: A. Hayward, A. N. Coleman and Nelson H. Olds.

TECUMSEH G. S. M. Co.—July 21. Trustees: J. Greif, H. Suhling, J. Hahn, G. Koppitz and L. Hazelquist.

SAVAGE M. Co.—July 21. Trustees: M. Morgenthau, I. Steinhart, Wm. H. Sharp, E. J. Baldwin and A. Goldsmith.

CALIFORNIA SALT MANUFACTURING Co.—July 21. Trustees: M. G. Kennedy, (President), James Del Johnson, (Secretary), P. H. Burnett, (Treasurer), Henry F. Williams, M. Fennel, J. C. Pillsbury and Thos. H. Purves, (Managing Director).

San Francisco Mining Stock Market.

MISCELLANEOUS STOCKS.

During the past week we note sales in the Board of a considerable amount of Legal Tenders, 60 shares Spring Valley Water at \$68 25@69 50 h 30, and 10 shares California Trust Co. stock at \$125 per share. The Savings and Loan Society (Clay street) announce a dividend of 11 per cent. per annum out of their earnings for the first six months of the current year, and the Hibernia 10 per cent. for the same period.

The following quotations have been carefully revised by F. H. Woods, Broker:

MINING SHARE MARKET.

Mining Share Market.

We have to report a tolerably active condition of the mining stock market for the past week, resulting in an increased volume of transactions, and at well maintained prices, Savage, Yellow Jacket and Original Hidden Treasure having been the most prominent.

From the report of the White Pine News, for the week ending July 23d, we extract the following opening remarks:

Matters in the mining world have materially improved for the past week. In White Pine, especially, better feeling obtains than for many months past. The transfer of leading properties, and resumption of operations thereon, has had the good effect to re-establish confidence among all classes in the wealth and ultimate prosperity of the District. The initiatory steps for the establishment of refining and separating works, both here and at Eureka, for the successful treatment of base bullion, has also contributed largely to the prospects of improved times in all branches of business. Upon the whole, it would nearly seem certain that the local monetary pressure, which has so long clouded and thwarted all legitimate enterprise, about being relieved, and that Eastern Nevada, and White Pine in particular, is just entering upon an era of unparalleled prosperity. It is true, that the beneficial results to come from the important improvements now in course of construction, are as yet scarcely noticeable; still, people generally are more hopeful of the future than at any time in the history of the District.

CHOLLAR-POZOS.—has been less active than during the previous week, at slightly reduced figures. For the week ending July 23d, 1186 tons of ore were extracted, showing an average assay value of \$61 87 per ton. We learn of nothing of importance with reference to further developments in the old working localities, and the drifts from the New Shaft do not give any better encouragement than previously reported. On the 26th inst., \$32,884 in bullion was sent forward to the office in this city.

HALE & NORCROSS.—has improved since our previous reference. For the week ending July 23d, 2,024½ tons of ore were taken from the mine, against 1,638½ tons the previous week. The winze is said to be upwards of 68 feet below the seventh station level, and as yet exhibits no change in the quality of ore they are passing through, the assays averaging from \$40 to \$55 per ton.

IMPERIAL.—was in the market to a larger extent than usual at well maintained rates. On the 25th inst., the west cross-cut had attained a distance of 27 feet, the face showing only barren quartz. The sinking of the shaft continues very favorable. At the old works they are getting along very well with retimbering, and think they will be able to start up by the first of August.

GOULD & CURRY.—sold quite freely at improved and fluctuating prices. During the week closing July 25th they extracted 201½ tons of ore, showing an average assay of \$31 17 per ton. The seam of ore in the south-east drift, about which the Superintendent telegraphed has as yet developed nothing of value.

KENTUCK.—sold at somewhat better rates. For the week ending July 23d, 186½ tons of ore were extracted, yielding, by assay valuation, \$2,830 97, equal to \$15 22 per ton. Otherwise nothing encouraging has transpired.

...Crown Point met with more than usual inquiry. During the week ending July 23d, 362½ tons of ore were taken from the mine, assaying \$4,034, or \$11 13 per ton. The incline is now down 154 feet, and the work in it is progressing very satisfactorily.

BELCHER.—is not much inquired for. A letter of the 21st inst., states that in the east drift, near the southern line, on the 730 level, they found several quartz seams running parallel with the drift, containing pay ore. The ore seam on the 152 level is somewhat narrower than heretofore, but the car samples give an assay value of over \$30. The 262 level is producing about nine tons of ore per day, assaying \$28 to the ton.—JULIA loved an assessment of 75 cents per share on the 22d inst.

NOONDAY (W. P.) levied an assessment of 20 cents per share on the 20th inst.—Commercial Herald.

SAN DIEGO.—The removal of the county officers from Old to New San Diego, does not seem to be so easy a matter after all. A lawsuit is threatened.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

Drilling Wheat.

We last week showed that however well land may be plowed, and however carefully this seed may be sown and covered, broadcast, it will be deposited at uneven depths and grow irregularly. The only way to secure the uniformity of growth, so desirable in wheat and other cereals, is by drill sowing. The advantage of this mode of putting in wheat may be summarized up as follows:

The seed is covered deeper; it is covered more regularly; less seed is required; it permits the destruction of weeds by mechanical means; there is a circulation of air through the growing grain, and it generally stands better in harvest time.

The practice of drilling in wheat is almost universal in England, and is fast coming into general practice in the Atlantic and Mississippi States. The department of agriculture has collated much information upon the two practices of broadcast sowing and drilling, and gives a decided preference to the latter.

The chief advantage desirable from drill-sowing is the regular deposition of the seed, at whatever depth may be chosen, which depth may be easily regulated according to the nature of the soil, climate, or whatever other local contingencies may exist.

FIG. 1.

Fig. 1 represents the seeds deposited by a drill. The figure being a cross section of the ground, it will be observed that the seeds are placed in rows at regular distances apart, and at a uniform depth. A good drilling machine, well handled on properly prepared ground, will always ensure the uniformity here represented. The manner of growth from such uniform

FIG. 2.

sowing is faithfully shown in Fig. 2, where the plants are seen to be all of the same height and strength, a circumstance which may reasonably be expected to result in the production of a uniform quality of grain. The saving of seed is also a very considerable item in economy of drill-sowing. This saving will range from 20 to 30 per cent or more.

The great evil of broadcast sowing, especially where thick sowing is practiced, is the crowding of the plants together into a space where neither sufficiency of air, or ground for the spreading of the roots can be obtained. The consequence is that, as soon as the plants have arrived at a period of growth at which their wants become most necessitous, a struggle for existence commenced between them, which terminates either in the killing off, or so retarding the growth of the weaker, that only imperfect grains are produced, which, if not taken away from the more perfect ones by the separator, brings down the average of the whole product to their own depreciated standard, and thus greatly reduces the value of the crops.

Another important advantage derivable from drill-sowing is the fact that, where the soil is much given to weeds, an opportunity is presented to destroy the same in the early stage of their growth, so as to give the wheat an opportunity to get such a start as to overshadow and kill out the

second or third crop of weeds. Such cultivation, and the free admission of air between the rows, down even to the roots of the plants, where its presence, in motion, is very necessary, secures a healthy growth and is serviceable, to a great extent, in preserving the grain from rust and other similar diseases, nearly all of which are more or less due to feeble growth and poor circulation.

We may here remark that the practice of thin sowing, and thorough cultivation, and dressing the soil, is making considerable, but by no means so much progress as it should do, at the East. It is, however, well understood and quite universally practiced in England. Thick sowing should not be practiced on rich or well-dressed soil; because it produces a dense mass of vegetation, which obstructs the passage of light and air to the roots, and prevents the "tillering" which is so natural to the cultivated cereals. "So eager are plants for light," says Mr. Mechi, the distinguished English farmer, "that, when deprived of it horizontally, they rush up vertically, become weak-legged, and tumble down prematurely. The robust, wide-spreading wheat plant, with its broad flag and bold, full ear, is crowded and cramped into a thin, weak stem, with puny ear, and few and small kernels. The stem, when it issues from the ground, is soft and spongy, instead of hard and glossy. This desire of plants for light is apparent under many circumstances." Raising wheat in drills furnishes the light and air so much needed.

In running a cultivator between rows of wheat, care must of course be taken that the ground is not stirred after the lateral or "crown" roots have been sent out in any great numbers in search of food, as the destruction or multiplication of these can scarcely be compensated by the removal of weeds.

As we have already said, the impression is fast gaining ground that drill-sowing is much superior to broadcast in agricultural practice; in fact, nothing is better established than this, and we have yet to learn of the first instance where its actual trial has failed of superior results. Reports at the Department of Agriculture, in Washington, from almost every section of the country, have shown, within the last two years, that in many instances, at least, there has been a gain in favor of drilling of 20 to 25 per cent. over broadcast sowing.

Drills, and cultivators suitable for use in connection therewith have been greatly multiplied and improved of late years, and are now constructed not only to sow wheat, oats, rye, etc., in any given quantity, but also to sow the same with grass seed and fertilizers.

ASHES FOR GRASS.—Mr. Reade, Superintendent of the Reade paper mill, in Connecticut, recently stated in the American Farmers' Club that he had cut from four to five tons of clover on two acres of land, which had been generously treated to a dressing of ashes (from fifty to seventy-five bushels to the acre) for two years, and that on other portions of the same field that had been manured exactly the same, without the ashes, the crop was not a ton. The ashes were a mixture of chestnut and oak. The land was sandy, and not very rich. Clay soils are but little benefited by ashes; but for sandy land good, hard wood ashes are almost invaluable.

TO GET RID OF STUMPS.—There are two very effective ways of disposing of stumps—not quite so effectual as the puller, but very handy when a puller cannot be readily obtained: Bore a number of holes and fill them again and again with sulphuric acid. This eats away the wood and hastens decay. Another is to fill the hole with petroleum or kerosene till the wood is pretty well soaked, and then the stump will burn off even with the ground.

Small-Fruit Cultivation—Hints.

BLACKBERRIES.—Those who raise blackberries must have noticed that some are sweeter than others; and not unfrequently those that lack in sweetness are good looking and plump. Again, some berries have a slightly bitter or insipid taste—this proper flavor is lacking. Now there must be a reason for these differences. Examine your vines. You will perhaps find a limb partly broken off, with berries upon it; taste them and they are bitter—insipid. The cause is the lack of vigor in the shoot upon which they have grown. Its mutilated state has prevented the proper amount of sap from finding its way to the fruit. If you will reflect a moment this hint will be sufficient. All your vines which bear imperfect fruit are lacking in healthy vigor. If the branches are not mutilated there is something the matter at the root. If the ground is packed, loosen it a little with a dibble or some instrument that will not cut off the roots, and manure it thoroughly, and you will be amply repaid for your trouble in the improvement of the next crop. Barren yard manure is good; decayed leaves or chip dirt are better.

Pruning is also very important with both the blackberry and raspberry. This should be done with care and judgment. The life of the shoots of these bushes ends with their second season. Last year's wood produces this year's fruit, and then dies; after which it should be carefully cut away—not broken or pulled.

Summer pruning is a good practice—the tops of the longest this-year shoots and their laterals are cut off—one-quarter to one-third of the length being removed. This should be done immediately after the fruit has been gathered—better than late in the fall. Such pruning greatly improves the fruit that will be produced on branches so treated the next season. Four or five canes to a stool is enough, and they should be kept tied to a stout stake. Set out in rows five to six feet apart, and place the hills four feet from each other.

The blackberry in two or three years forms a complete network of long, fleshy roots, which will throw up numerous canes unless measures are taken to destroy the young shoots. These shoots should be kept down with much care, or you cannot have vigorous plants and good fruit. The roots can be kept within any desired bounds by surrounding them with 12 or 14-inch boards, placed edgewise in the ground, so that the top edge is just even with the surface.

RASPBERRIES will grow well on almost any soil that will produce good corn, if the ground is kept loose and well cultivated. They do not require a wet or even moist soil. Raspberries will yield plentifully, even in a dry season, on soil where you may have to dig from 25 to 40 feet for water, provided the ground is kept well cultivated up to the time of ripening the fruit, and the fruit is cultivated in an open manner; while without frequently stirring the soil the crop will fail on ground where water may be reached in ten feet, especially if the plants are crowded together so as to prevent a proper access of the sun to the roots. Open cultivation, heavy mulching immediately around the bush, and a frequent stirring of the soil, will do wonders with the raspberry.

GOOSEBERRIES should be well cultivated, and the branches so thinned out as to admit the sun freely to the roots. It is also an advantage to keep the ground well mulched. Decayed leaves or fine chip dirt make the best mulching material. Gooseberries may be packed for the market in crates or boxes; but care should be taken that they are not placed in too large packages, else they may "beat."

The **WHORTLEBERRY** is a much-neglected fruit, though without reason; for it is much liked, and makes a most excellent

pie. It is rarely found in our gardens or small-fruit patches, though there is no difficulty in its cultivation, wherever a proper soil can be obtained for its growth. The whortleberry likes a moist, spongy soil, not over rich. This blueberry is especially dependent upon moisture. These berries are very rare on this coast, although there are locations where they might be cultivated to advantage. They have the important advantages over most other small fruits—of excellent keeping qualities. The Whortleberry is capable of much improvement by cultivation. With care it may be grown much larger and more juicy than when it is confined to its wild or natural state.

The Yosemite Black-Cap Raspberry.

As there has been much enquiry as to the merits of this fruit, and I have promised several parties that I would examine and report upon it, I have visited the grounds of Mr. T. S. Fitch, in Alameda, and am prepared to express an opinion. He has about a half acre of vines, three years old. They are very strong and vigorous growers; the color of the bark is a purplish brown, spotted with green. The foliage is abundant and resembles the blackberry. The whole plant, even to the spines of the leaves, is savagely armed with thorns. It fruits sparingly and the berry is scattering. They are flatter in shape and quite as large as the common cultivated sorts. It lacks the rich and sprightly flavor of the wild raspberry of the East; but has a singular, though not unpleasant taste. When fully ripe, it is soft and quite black, yielding a beautiful crimson juice when crushed. Mr. F. prefers it as a table fruit, with sugar and cream, to any other.

While I might advise amateurs to try a few plants as a curiosity, I must nevertheless pronounce it a failure, and worthless for field culture. Even if it did produce well, which it does not, the fruit is too soft to bear handling for market. Several parties have been to considerable expense in propagating this variety, with the intention of profiting by its introduction; but it is now admitted to be a failure.

S. H. HERRING.

CEDAR ASHES.—A gentleman living in Pine Valley, near Palisades, on the Central Pacific Railroad, recently reported to our correspondent, "W. H. M.," that he had placed a lot of cedar ashes and decomposed chips of the same wood (such as grows in that region) upon a garden patch, and that the dressing thus employed had destroyed all vegetation upon the same. The ashes certainly could not have worked the destruction of his vegetables. No soft wood ashes are of much value as a manure; but they do not possess any property which would be injurious to the soil. Chips or sawdust, from the tannic and other acids which they contain, might have so "sonred" the soil as to have rendered the same unfit for most vegetable growths. A free use of lime would neutralize such acid and restore the soil to its former condition; while the subsequent gradual decay of the chips and sawdust might therefore act as a slow, but very effectual fertilizer.

GROUND CHEAT FOR BEE FOOD.—Mr. R. R. Hudson, of Culpepper county, Pa., writing to the *Bee Journal*, says: Last spring I had about two bags of cheat to grind; and before I had ground the half of it my bees came to the meal chest in large numbers, and commenced packing it on their legs. I then ground some nice rye, and placed it in a box side by side with the cheat. The result was the bees would not touch the rye, but worked vigorously on the cheat. I then took a box of each, and placed them near the hives, with the same result.

NORWAY OATS.—The Nevada *Transcript* says that Mr. Rodden has some six acres of Norway oats growing near Bear river, which bids fair to yield enormously. Some of the stocks are six feet three inches high! This item is especially suggestive of the importance of our mountain lands for agricultural purposes.

The Santa Cruz Farmers' Club.

The principal business before the club at their meeting on the 16th inst. was, to the reading and consideration of the report of the Committee on Taxation, appointed at the previous meeting. The report was fully endorsed by a vote of the club, and, on motion of the Secretary, Mr. J. W. Morgan, it was voted to furnish a copy for publication in the local papers, and also to the State Board of Equalization, asking their advice in the matter. A copy of the report was also forwarded to this office, for publication in the SCIENTIFIC PRESS.

After disposing of this report, the subject of "Breeding and Managing Stock" was discussed at considerable length, and finally laid over for further consideration at the next meeting, which will be held on the first Saturday in August.

As this report of the committee on the taxation of lands in Santa Cruz county covers a cause of complaint which appears to be quite general throughout the farming counties of the State, we give it entire, as a matter of general interest. It is to be hoped that the State Board of Equalization, to whom it has been now referred, will give this whole matter of the asserted unequal taxation of our farming lands that attention which the importance of the subject demands. We shall watch with interest for the action of that body thereon.

Report on the Taxation of Farming Lands in Santa Cruz County.

Your committee appointed to collate some authentic and reliable facts relating to the inequality of assessments in Santa Cruz county, beg leave to report that they have carefully examined the assessment roll for 1869 and '70, and cite the following cases to show how unequally the burden of taxation is borne by our people:

Davis & Cowell own, in the immediate vicinity of Santa Cruz, 5,124 acres of land, a portion of which is valuable for agricultural purposes; but especially so, because of the rich and extensive beds of lime rock upon it; while the balance of this land, situated on the San Lorenzo river, is covered with some of the finest timber in the county; and yet this land is assessed at only on an average of \$4.31 per acre.

Mr. Rufner has a farm of 143 acres on the coast road, assessed at \$12 per acre; while H. P. Rice's $3\frac{1}{2}$ acres adjoining is assessed at \$120 per acre.

County Assessor Taylor owns 10 acres of land in this neighborhood, assessed at \$30 per acre, and Wm. H. Mason's 6 acres across the road, and of no more value, is assessed at \$80 per acre.

The farm of Supervisor Anthony, of 88 acres, valuable for town lots, is assessed at about \$30 per acre; while several of his neighbors who own each a few acres are assessed at prices ranging from \$75 to \$100 per acre.

In Soquel, the home farm of John Dauenbiss, consisting of 300 acres, is assessed at \$15 per acre; while Dr. Robertson's $9\frac{1}{2}$ acres adjoining are valued at \$46 per acre.

Mr. Averone has 55 acres of land where he lives in Soquel, assessed at \$32 per acre; and F. A. Hihn owns better land by the side of it assessed at \$10.34 per acre.

The farm of Augustus Noble, of 116 acres—some bottom land—is assessed at \$9.60 per acre; but Patrick Cassidy's $8\frac{1}{2}$ acres, same quality of land, adjoining, is assessed at \$37 per acre.

F. A. Hihn's land—5,070 acres—in the Soquel Augmentation, valuable for its fine timber, as well as for grazing and vineyard purposes, is assessed at less than 82 cents per acre. The very valuable farm of 115 acres of bottom land, worth \$75 per acre, of Supervisor Dean, was assessed at \$9.50 per acre, but reduced by the Board to \$3.50 per acre.

The cases above cited are only a few of those which might be taken from the last assessment roll to prove the inequality and unfairness of assessments in this county. Your committee does not say that the Assessor and Board of Equalization are acting in collusion with certain large land owners to save them from the payment of their just share of taxation; but we do say that this kind of assessment and equalization compels the small farmer and poor man to pay the rich man's taxes. We think the Board of Equalization is greatly at fault. The few acres of the small farmer and poor man are raised, unless the Assessor has already valued his land at two or three times that of the rich man's, and this

is often done without his receiving the legal notice to which he is entitled. But this Board seems to lack the moral courage to raise up to a fair valuation the land of the rich man, whose broad acres embrace the richest and finest lands in the county. No uniform rule seems to govern the action of these men in this matter of equalization. The mortgages of some men in 1869 were cut down, while others had to pay taxes on their securities to the extent of their full cash value. These mortgages, all recorded in the Book of Mortgages, lay before them, and they should have served all alike.

The Board, however, is very kind to its own members. The farm of Supervisor Dean, assessed at less than one sixth its value, was reduced \$700; the farm of Supervisor Anthony, assessed at less than one-third its value, was cut down \$800, and even the County Assessor was kindly remembered, and \$160 was taken off the assessment of his own property.

Respectfully submitted.

D. C. FEELY,
Chairman Committee.

What I Know of Farming—No. 28.

Grain-Growing—East and West.

I disclaim all pretensions to ability to teach Western farmers how to grow Indian corn abundantly and profitably, while I cheerfully admit that they have taught me somewhat thoroughly worth knowing. In my boyhood, I boed corn diligently for weeks at a time, drawing the earth from between the rows up about the stalks to a depth of three or four inches, thus forming hills which the West has since taught me to be of no use, but rather a detriment, embarrassing the efforts of the growing, hungry plants to throw out their roots extensively in every direction, and subjecting them to needless injury from drouth. I am thoroughly convinced that corn, properly planted, will, like wheat and all other grains, root itself just deep enough in the ground, and that to keep down all weeds and leave the surface of the corn-field open, mellow, and perfectly flat, is the best as well as the cheapest way to cultivate corn. And I do not believe that so much human food, with so little labor, is produced elsewhere on earth as in the spacious fields of wheat and corn in our grand Mississippi valley.

And yet I have seen in that valley many ample stretches covered with corn, whereof the tillage seemed susceptible of improvement. Riding between these great corn fields in October, after everything standing thereon had been killed by frost, it seemed to my observation that, while the corn crop was fair, the weed crop was far more luxuriant; so that if everything had been cut clean from the ground, and the corn and the weeds placed in opposite scales, the latter would have weighed down the former. I cannot doubt that the cultivation, or lack of cultivation, which produces or permits such results, is not merely slovenly but unthrifty.

Grain-Growing in the West.

The West is for the present, as for a generation she has been, the granary of the East. In my judgement, she will not long be content to remain so. Fifty years ago, the Genesee valley supplied most of the wheat and flour imported into New England; ten years later, Northern Ohio was our principal resource; ten years later still, Michigan, Indiana, Northern Illinois and Eastern Wisconsin, had been added to our grain-growing territory. Another decade, and our flour manufacturers had crossed the Mississippi, laying Iowa and Minnesota under liberal contributions, while Western New York had ceased to grow even her own breadstuffs, and Ohio to produce one bushel more than she needed for home consumption. Can we doubt that this steady recession of our Egypt, our Hungary, is destined to continue. Twenty-three years ago, when I first rode out from the then, rising village of Chicago to see the Illinois prairies, nearly every wagon I met was loaded with wheat, going into Chicago, to be sold for about 50 cents per bushel, and the proceeds loaded back in the form of lumber, groceries, and almost everything else, grain excepted, needed by the pioneers, then dotting, thinly and irregularly, that whole region with their cabins. Now, I presume the district I then traversed, produces hardly more grain than it consumes; taking Illinois altogether, I doubt that she will grow her own breadstuffs after 1880; not that she will be unable to produce a large surplus, but that her farmers will have decided that they can use their lands otherwise to greater advantage. Iowa and Minnesota will continue to export grain for perhaps twenty years

longer; but even the time will come for saying, "New York and New England (not to speak of Old England) are too far away to furnish profitable markets for such bulky products; the cost of transportation absorbs the largest part of the cargo. We must export instead wool, meat, lard, butter, cheese, hops, and various manufactures, whereof the freight will range from two up to not more than twenty-five per cent. of the value." They will thus save their soil from the tremendous exaction made by taking grain crop after grain crop persistently, which long ago exhausted most of New England and Eastern New York of wheat-forming material, and has since wrought the same deplorable result in our rich Genesee valley, while Eastern Pennsylvania, though settled nearly two centuries ago, having pursued a more rational and provident system of husbandry, grows excellent wheat crops to this day.

Grain-Growing in the East.

I insist that the States this side of the Delaware, though they will draw much grain from the Canadas after the political changes that cannot be far distant, will be compelled to grow a very considerable share of their own breadstuffs; that the West will cease to supply them unless at prices that they will deem exorbitant; and that grain-growing eastward of a line drawn from Baltimore due north to the Lakees will have to be very considerably extended. Let us see then, whether this might not be done with profit even now, and whether the East is not unwise in having so generally abandoned grain-growing.

I leave out of the account most of New England as well as of Eastern New York, and the more rugged portions of New Jersey and Pennsylvania, where the rocky, hilly, swampy face of the country seems to forbid any but that patchy cultivation, wherein machinery and mechanical power can scarcely be made available, and which seem, therefore, permanently fated to persevere in a system of agriculture and horticulture not essentially unlike that they now exhibit. In the valleys of the Penobscot, the Kennebec, the Hudson and of our smaller rivers, there are considerable tracts absolutely free from these natural impediments, whereon a larger and more efficient husbandry is perfectly practicable even now; but these intervals are generally the property of many owners; are cut up by roads and fences; and are held at high prices; so that I will simply pass them by, and take for illustration the "Pine Barrens" of Southern New Jersey, merely observing that what I say of them is equally applicable, with slight modifications, to large portions of Long Island, Delaware, Maryland, Virginia, and the Carolinas.

The "Pine Barrens" of New Jersey

are a marine deposit of several hundred feet in depth, mainly sand, with which more or less clay is generally intermingled, while there are here and even broader stretches of this material nearly or quite pure; the clay is sometimes underlying the sand at a depth of 10 to 30 or 40 inches. Vast deposits of muck or leaf mold, often of many acres in extent and from two to twenty feet in depth, are very common; so that hardly any portion of the dry or sandy land is two miles distant from one or more of them, while some is usually much nearer; and half the entire region is underlaid by at least one stratum of the famous marl (formed of the decomposed bones of gigantic marine monsters long ago extinct) which has already played so important and beneficent a part in the renovation and fertilization of large districts in Monmouth, Burlington, Salem, and other counties.

How to Farm in New Jersey.

Let us suppose now that a farmer of ample means and generous capacity should purchase four hundred acres of these barrens with intent to produce therefrom, not sweet potatoes, melons, and the "truck" to which Southern Jersey is so largely devoted, but substantial grain and meat; and let us see whether the enterprise would probably pay.

Let us not stint the outlay, but presuming the tract to be eligibly located on a railroad not too distant from some good market, estimate as follows:

Purchase-money of 400 acres at \$25 per acre	\$10,000
Clearing, grubbing, fencing and breaking up ditto at \$20 per acre, over and above the proceeds of the wood	8,000
One thousand bushels of best marl per acre, at 6 cents per bushel delivered	24,000
One hundred loads of swamp muck, per acre, at 50 cents per load	20,000
Fifty bushels (unshelled) of oyster-shell lime (to compost with the muck), per acre, at 25 cents per bushel, delivered	5,000
One hundred tons of bone flour at \$50 per ton	5,000
[Net cost, \$180 per acre.] Total	\$72,000

I believe that this tract, divided by light fences into four fields of 100 acres each, and seeded in rotation to corn, wheat, clover and other grasses, would produce fully 60 bushels of corn and 30 of wheat per acre, with not less than three tons of good hay, and that, by cutting, steaming, and feeding the stalks and straw on the place, not pasturing, but keeping up the stock, and feeding them, as indicated in a former chapter of these essays, and selling their product in the form of milk, butter, cheese and meat, a greater profit would be realized than could be from a like investment in Iowa or Kansas. The soil is warm, readily frees itself, or is freed from surplus water; is not addicted to weeds; may be plowed at least 200 days in a year; may be sowed or planted in the Spring, when Minnesota is yet solidly frozen; while the crop, early matured, is on hand to take advantage of any sudden advance in the European or our own seaboard markets. Labor, also, is cheaper and more readily procured in the neighborhood of this great focus of immigration than is or can be in the West; and our capable farmers may take their pick of the workers thronging hither from Europe, at the moment of their landing on our shore. Of course, the owner of such an estate as I have roughly outlined, would be likely to keep a part of his purchase in timber, improving the quality thereof by cutting out the less desirable trees, trimming up the rest, and planting new ones among them; and he would be almost certain to devote some part of his farm annually to the growth of roots, vegetables and fruits. But I have aimed to show only that he would grow grain here at a profit, and I think I have succeeded. His 60 bushels of corn (shelled) per acre could be sold at his crib, one year with another, for 60 silver dollars; and he need seldom wait a month after husking it for customers who would gladly take his grain and pay the money for it. This would be just about double what the Iowa or Missouri farmer can expect to average for his corn. The abundant fodder would also be worth in New Jersey at least double its value in Iowa; and I judge that the farmer able to buy, prepare, fertilize, and cultivate 1,200 acres of the Jersey "barrens," could make more than thrice the profit to be realized by the owner of four hundred acres. He would plow and seed, as well as thrash, shell, cut stalks and straw, and prepare the food of his animals wholly by steam power, and would soon learn to cultivate a square mile at no greater expense than is now involved in the as perfect tillage of 200 acres.

This essay is not intended to prove that grain is not or may not be profitably cultivated at the West, nor that it is unadvisable for Eastern farmers to migrate thither in order so to cultivate it. What I maintain is, that wheat, Indian corn, and nearly all our great food staples, may also be profitably produced on the seaboard, and that thousands of square miles now nearly or quite unproductive may be wisely and profitably devoted to such production.—
Horace Greeley.

WHEAT ON SHERMAN ISLAND.—The *Alta* gives the following experience in raising wheat on the newly cleared porous soil of Sherman Island: "A field of one hundred acres of wheat on Sherman Island seemed to have reached its full growth in the middle of May. The stalks, though less than a foot and a half high, began to turn dry and bead out, and as they were sparse the prospect for the crop was not promising. The owner of the farm, Mr. Seaver, as an experiment, let in the water from the Sacramento river at every high tide in the day-time for a week. The stalks turned green at once, stood out, threw up a multitude of new shoots, grew up three feet high, formed heavy heads, and will, it is estimated, yield forty bushels of grain to the acre. Next year Mr. Seaver will irrigate his wheat in the latter part of April, without waiting for it to show by drying up that it needs water."

TO KEEP INSECTS AWAY.—The best way to guard against the ravages of insects, whether upon trees or grain, is to feed the land well and cultivate it carefully, so as to insure a healthy, vigorous growth. Fat cattle are seldom lazy.

Good Hay, cut and cured in the proper time, and well, is worth much more in market and to feed than its opposite. Good farmers know the time when they should cut their grasses, and it should not be delayed.

IMPORTANT.—The Mechanics' Institute intends holding a Horticultural, Agricultural and Pomological Exhibition in the Pavilion, commencing August 29th, and lasting five days. The representatives of twenty-four agricultural and horticultural journals are on the way to our State, and it is desirable that the exhibition be made worthy of California. The exhibition will include fruits, wines, flowers, ferns, shrubs, trees, grains, vegetables and kindred articles. Cash premiums will be awarded to the amount of five thousand dollars. Our farmers, gardeners and others are requested to act quickly in the matter, as the time for preparation is short. May the request meet with a prompt and generous response. Any desired information can be obtained by applying to the Librarian 27 Post street, or by letter to H. C. Kibbe, Corresponding Secretary Mechanics' Institute, San Francisco.

THE MISSION WOOLEN MILLS.—The project of building the large woolen mills on the flats, near the mouth of Islais creek, has been abandoned for the present, and the Old Mission mill at the corner of Folsom and Sixteenth streets, has been again started up. The knitting machinery of the Pacific mills has also been removed to the Mission mill. The stringency of the money market and the uncertainty of labor at the present time, has rendered such a course imperative for the time being. The foundations of the new mill have been completed, and though further work upon the same has been suspended for a time, the project of building a mammoth mill at that locality has been in no wise abandoned.

LIVERPOOL METAL MARKET.—Lewis & Son's Report for July. The copper market was decidedly more lively with a considerable advance. Copper ore quoted at \$3.35 to \$3.40 per unit. The stocks at Liverpool and Swansea are estimated as equal to 16,628 tons fine. Other quotations are,—quicksilver, \$39.25 per bottle; antimony regulus, \$375 to \$380 per ton; tin, \$620 to \$665; manganese without alteration, \$20 for 75 per cent.

It is reported that Omaha will put up reduction works on a mammoth scale. G. T. will supply the wind.

California Agricultural Notes.

THE HARVEST.—However poorly the harvest may be turning out in some of the lower counties of the State, the central and more northern portions are returning a full average yield.

In the extreme northern counties agriculture is attracting more and more attention with each passing year, and farmers in that region are stocking their farms more thoroughly with improved tools and machinery, such as machine rakes, mowers, threshes, etc. More attention is also being paid to the selection of seeds. The crops in the extreme north, which it was feared at one time were severely injured by the frost, never presented a more promising appearance than at the present time; the harvest is already well in progress. The farmers in Scott Valley, and in some of the northern valleys, who cut their wheat for hay, are now regretting the act.

HIGH LANDS BETTER IN DROUTH.—The *Calaveras Chronicle* says: "for some cause drouth does not appear to affect cereals sown on lands above a certain altitude; but, on the contrary, dry seasons are invariably productive of large yields of grain. When it is considered that the soil is loose and gravelly, not adapted to holding moisture, a person would naturally suppose that the opposite would be the case. We can account for the circumstance only upon the hypothesis that the clay sub-soil, generally found at the depth of two or three feet, prevents the escape of moisture until sufficient time has elapsed for the grain to ripen." The *Chronicle* is undoubtedly correct in its surmises, and the fact affords another evidence of the value of the too much neglected foot-hills for agricultural purposes.

NUTS.—The *Stars and Stripes* says that in the gardens of John White, in Auburn may be seen a number of young hickories, a foot or two in height and growing finely, the first success in hickory culture in California of which we have heard. W. M. Crutcher has chesnuts, both Italian and Japanese, that have made splendid growth and are doing finely. Almond trees, yielding 100 pounds per annum, within few years after planting or grafting, are not uncommon in this vicinity.

NEW WHEAT is arriving at all the interior shipping points in large quantities, and generally of a superior quality. Upwards of 600 tons are stored in one ware room in Colusa, where, on the 18th, buyers were offering \$1.57, without finding any disposition to sell. The wheat crops of Butte county will largely exceed that of last year. Much difficulty is found in getting the fields cut in proper time, as the grain matures rapidly and demands the scythe all at once.

GOOD WORK.—Last week, says the *Marysville Appeal*, Mr. Jacob Myers, of Grand Island, with one of Pitt's improved steam threshers, threshed during his first six days threshing from stacks, 12,200 bushels of grain, being an average of 2,033 1/4 bushels a day. Barley was threshed the first day, and wheat the remaining five days.

NEW FLOURING MILL.—N. R. Seely, from Iowa, is erecting a new flour mill on Putah creek, about 15 miles from Vacaville. Only two runs of stone will be fitted for the present. Increased facilities will be added should sufficient inducement offer to warrant the investment. The location is in the midst of a large grain-producing district.

THE DROUGHT.—The *Stockton Independent* says: "It has been clearly demonstrated by this summer's experience, that a careful and thorough cultivation of the soil is the only way to secure a crop, and that the old way of plowing and sowing must be abandoned." * * The only true successful farmers we have in San Joaquin county are those who have not farmed over 320 acres of land."

Beazell's Flux for Iron and Steel.

We find in the columns of the *Scientific Journal* a long article on a new discovery made by Gen. Jno. W. Beazell of Philadelphia. This appears to be a flux (it is called sometimes a "flux" and sometimes a "process") which has the properties, as is claimed, of firmly welding iron and steel so that the weld is as strong as, or stronger than, the parts; of preventing the destruction of all grades and qualities of steel by burning; and of restoring the

FIG. 1.

1. Line of Fracture in Steel. 2. Weld—Intact. 3. Fracture in Iron.

burnt metal; of turning old scraps of Bessemer steel into good solid rails, directly from the rolls; of producing iron of an excellent grade from red and cold short ores; of welding copper into all forms, etc.

When we see great claims made for some patent process, our first impulse is to doubt, especially when, as in this case, we are not given to understand exactly what the thing is. But here we have a scientific paper speaking very favorably of it, and producing a number of certificates which are most positive in its favor. We reproduce a couple of illustrations showing the effect of the flux. Fig. 1 represents

FIG. 2.

the appearance of an iron rail, which was steel-capped by the process, then reversed and placed under a five-ton steam hammer, with a capacity of a blow of 100 tons. The blow fractured the steel and the iron, but left the weld intact. Figs. 2 and 3 are descriptive of an experiment made at the shops of the Pennsylvania Railroad Co. A Vicker's steel axle was cut in two, in the manner shown in Fig. 2, and welded solid at one heat. "A pressure, in a hydraulic press, of 120 tons right across the weld (Fig. 2) was unable to break it; but at a reverse pressure (Fig. 3) of 115 tons the

FIG. 3.

axle was broken. The weld was as sound and the metal as good as the other portions of the axle." Similar certificates follow which are similarly favorable.

Companies have been formed for the purchase of the patent right, and we shall undoubtedly hear more from the process. A chemical analysis will of course readily show of what the flux is composed, and we expect soon a fuller explanation of its qualities and action. If its claims are just, it is certainly a most important discovery.

MR. J. J. Mayfield, of Sutter county has a colt only four months and sixteen days old, which weighs 500 pounds.

Treatment of Ores.

Küstel's new book on the treatment of gold and silver ores without quicksilver, has just been published by Dewey & Co. It is neat in appearance, handsomely printed by Spaulding & Barst in the *Scientific Press* office, liberally illustrated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. Every miner and every millman will find much in it which will show him how to avoid many difficulties, and how to make many improvements, and throughout the book passages are continually occurring which will meet each one's individual troubles to a very considerable extent.

The book does not pretend to be entirely original, but is largely a condensation and simplification of much that has already been published, either in German or English. But in it, in the various descriptions and explanations, hints and remarks are being continually made which give it a peculiar value for the coast, and that which is new is founded on a good theoretical knowledge, and proved by a large practical experience with our various ores. It is divided into four parts; I, The Introduction, treating briefly of ores, and of Desulphurization, Reduction and Chlorination in general; II, Roasting of Ores, entering into a detailed description of the various furnaces and processes, and giving explanations of the latter; III, Extraction of Silver by Lixivation, showing how this is done, and when it is advisable, especial reference being also had to amalgamation; and IV, Extraction of Gold by Chlorination.

The price of the book has been fixed at two and a half dollars, a sum which is much too large to be thrown away on much of the stuff which appears in the shape of books, but which is certainly none too high for the present volume. Can we recommend it to our readers? We certainly can. Although of comparatively small size, a duodecimo of 142 pages, it contains a very large amount of information, all the more valuable for being well condensed and digested.

Well Trained Alcohol.

It would seem that a new process, on totally new principles, for the manufacture of heat-sugar, has been discovered in Germany (or in San Francisco). A rather startling description of the supposed process was given in the *Alta* a couple of weeks ago. For instance, it would appear that alcohol is made to take the place of water in dissolving sugar, "the salts, the albumen, and all other impurities remain in the pulp, the alcohol taking up merely pure sugar, and leaving none behind, etc., etc. Hitherto alcohol has been popularly supposed to be a very poor solvent for sugar. Will the *Alta* please explain how it is licked into the proper shape for this process?

At Edinburgh, Thomson's road steamer has been employed for handling heavy guns of position. By means of one of these, according to the *Scotsman*, two guns of 50 cwt. were moved at the rate of six miles an hour, and wheeled while moving at that speed in a space eight yards in breadth. It is said that a number of the steamers are being made for the English and Indian governments, and it is thought that they will in the future be extensively used for this purpose.

TEA PLANTS IN AUBURN.—The *Auburn Stars and Stripes* says that several Japanese tea plants are growing and flourishing finely in the garden of Moses Andrews, at Prospect Hill. The plants were presented to Mr. A. by Mr. Schnell, of the El Dorado tea colony.

BOOKS RECEIVED.—We have received, just before going to press, several books which will be noticed hereafter.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JULY 19TH.

WASHING MACHINE.—Benj. Hockabout, Antioch, Cal.

PIPE-COUPLING.—Richard Hoskin, Dutch Flat, Cal.

ALARM TICKET-NIPPERS FOR COUPON TICKETS.—Isaac Hyde, Oakland, Cal.

CONCRETE PAVEMENT.—Robert Skinner and Robert Bonnet, San Francisco, Cal.

CABLE-STOPPER.—James Stitt, San Francisco, Cal.

CONDIMENT OR RELISH.—William Francis Swasey, San Francisco, Cal.

DEVICE FOR CURLING HAIR.—S. Lee Tibbala, Dutch Flat, Cal.

CENTRIFUGAL SUGAR-DRAINING AND MOLDING-MACHINE.—Patrick Tully, San Francisco, Cal.

GANG-PLOW.—Elisha W. Walton, San Leandro, Cal.

WEED CUTTER.—Elisha W. Walton, San Leandro, Cal.

OSCILLATING ENOINE.—Issued July 12th. Thos. Hill, Vallejo, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

PIPE-COUPLING.—R. Hoskin, Dutch Flat, Cal. As an invention which may be of very considerable value in hydraulic mining, besides in its other applications, this invention deserves some considerable notice. It is an improved movable joint for connecting the sections of pipes and tubing, and is a modification of the form known as the ball-and-socket joint. The following will give a general idea of the device: A cup-shaped socket is formed, which has at the smaller end a flange, which is to be connected with one section of the pipe or tube in any suitable manner. The other pipe-section has at its corresponding end a flange standing at right angles to, and fitting against, the curved sides of the cup-socket. A strip of leather or other flexible material is prepared and placed with its inside rim against the underside of the last flange (where it is properly fastened,) and its projecting part is then turned over so as to form an apron or packing-rim by fitting closely against the walls of the socket, when there is a pressure of water in the pipe, and thus preventing any escape at the moving joint. The end of the section being thus prepared, it is inserted into the socket and confined therein by two small wheels or friction rollers, with convex sides and properly adjusted, so that the section can be freely moved in the socket and handled with ease.

WASHING MACHINE.—B. Hockabout, Antioch, Cal. Any device which will render easier the labor at the washing tub is a benefit both to the male and female sex, and to the bachelor as well as the benedict. As one of those who indulge in the luxury of a "biled rag," we are glad to see inventions made in this line. The one in question consists of a number of corrugated roller rubbers, which are suspended at the extremities of springs secured around the rims of two wheels. The articles to be washed are placed on a concave washboard which is also suspended on suitable springs; these allowing the board to yield under pressure. The wheels being revolved by proper mechanism, the rubbers are rolled over the clothes on the washboard. There are suitable arrangements for having hot water, etc.

CONDIMENT OR RELISH.—W. F. Swasey, S. F. This palatable article has already become familiar to many of our readers under the name of "California Bonzest." It is compounded of substances not at all injurious to the health, and hence can be safely recommended to those who like it, and those who do not know whether they like it or not, can be safely advised to try it. It may be added that, according to appearances, most of those who have tried it, do like it.

The Howland Rotary Quartz Mill.

We have on a previous occasion illustrated this mill, as it was some time ago. Since that time, however, Mr. Howland has been busily occupied at the East making additions and improvements, and we now give an illustration of his mill in its best shape. Concerning its various parts and its capabilities, we find the following in the *New York Eng. and Min. Journal*: This mill has been running for the last nine years with good success in California and Nevada, and has from time to time been improved to keep up with the wants of the

tween, thus avoiding the loosening of nuts and bolts and the granulating and weakening effects produced by the jar.

The weight of stamps is from five to six hundred pounds. The shoes and dies are made of the best white iron. The stamps revolve while being raised by the cam, consequently there is but a small amount of friction, and as they continue to revolve until they strike the die, both the shoes and dies are kept square on the face, doing more and better work than the straight mill. The stamps, dropping one after the other, force the pulp or rock around the mill, distributing it so that each stamp has

tions, while the old mill had columns; the gear is taken from the top and put nearer the base, giving less vibration; it is made much heavier; the guide-boxes for stems are of oak; the wood packing between the sections to take off the jar; besides, many other little annoyances are obviated to which other mills are subjected. These, mill-men know, are of great importance in keeping a mill running, as there is no pay coming while a mill is under repair, and the continuous stopping and starting is very detrimental to milling.

These mills are no longer an experiment; they have been proved by use for the last seven years in Australia with perfect success. They are manufactured at Sydney, by Messrs. Smith & Russell, who give them the credit of being the best stamp mill built.

Mr. Howland has returned from the East, and is now stopping in this city for a short time, and advertises in our columns to receive orders for machinery on favorable terms. His friends and those desiring to transact business will find them by calling on Messrs. S. W. Howland & Co., 413 and 415 Mission street, S. F., to the care of which firm any letters may be addressed.

AGENTS IN THE FIELD. L. P. McCarty a well-known traveler on this coast, commences a trip next week as agent and correspondent of the Press. He will visit the mining counties north of and along the C. P. R. R. Mr. L. Miner is now in Nevada and will eventually visit Montana and Colorado. Mr. W. H. Murray will attend to our affairs in Utah, and probably extend his tour to the Western and Eastern States. Mr. A. Freedman is now in Contra Costa County, on his way to San Joaquin and Mariposa counties. Our agricultural correspondent, Mr. S. H. Herring, is paying a second visit this season to our friends in Alameda and adjoining counties.

GLASS TUBE CUTTER.—A little instrument for this purpose, recently designed by Ducomet, of

Paris, consists of a rod covered with cotton and bearing at one end a diamond set at right angles to its axis. A guard held by a clampscrew, gauges the desired length of the piece to be cut off. The rod is introduced into the glass tube up to the guard, and the mark made by simply turning it round. The division is then effected by bending the tube, by holding it above a candle flame.

RICH IRON ORE.—Considerable excitement is reported as occasioned in Tazewell and Fulton counties, Illinois, by the discovery of bog ore containing 95 per cent. of iron. We should ourselves be considerably excited if we found this percentage of metal in any ore. We give notice that we are about to discover some ore holding 12½ per cent.

HOWLAND'S PATENT ROTARY PULVERIZER AND AMALGAMATING QUARTZ MILL.

mining interest. It is now for the first time offered to the public on the Atlantic coast, as one of the best, cheapest, and most effectual pulverizers and amalgamating machines ever gotten up. It costs nearly one-half less when put up ready to run than the straight mill. It can be put up at the mine ready to run in three days; and, with good ore, will pay for itself while a straight mill is being erected. It is built in the most substantial manner and of the best material. Each mill is put running at the shop, so as to avoid all annoyance of bad fitting or lack of parts. These mills are cast in sections, so as to be easily transported. If the mine does not pay, the mill can be taken down and removed without damage. The wearing parts are so arranged that they can be duplicated at any time. Each section is faced off, and three-eighths of an inch of wood put be-

an equal amount of rock. The speed of these mills is from one hundred to one hundred and ten drops per minute. It has more screen surface than the ordinary mill, and is better protected, the rock being fed in at the hub or centre. It does not come in contact with the screens until it is partially crushed. It has been demonstrated that a light stamp and a short, quick drop does the best work, and when amalgamating in the mortar mixes the pulp and quicksilver thoroughly together, giving the quicksilver no chance to lie still until it is amalgamated with the metals, when it drops at the bottom of the screen, and is safe.

For these reasons, this mill is a much better amalgamator than the old style of mill. It is also adapted to dry crushing as well as wet. Some of the improvements made in this mill are, that it is cast in sec-

CALIFORNIA ASSAY

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

FOR SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others. We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16720-3m JOHN F. LOHSE, Secretary.

IMPORTANT NOTICE.

On SATURDAY, THE SIXTH DAY OF AUGUST, we propose publishing an
IMMENSE DOUBLE-SHEET EDITION

— OF —

THE SCIENTIFIC PRESS,

Containing about sixty columns, devoted exclusively to information concerning the

Agricultural, Manufacturing and Other Resources of California,

ENTITLED,

"A GUIDE FOR EMIGRANTS TO CALIFORNIA!"

Great care and much labor has been bestowed upon the compilation, in order to supply a much-needed want—viz: reliable facts in a condensed, readable and cheap form for the use of persons abroad desirous of emigrating to CALIFORNIA.

The following will be the most prominent features embraced:

Climate and Soil; Natural Wealth and Resources; Productions in Agriculture and Manufactures; Past, Present and Future of the State; Agricultural Districts; Public Lands; Laws Relating to Pre-Emption and Homesteads; Tables of Statistics from Official Reports; Lands for Sale; Railroads; Routes of Travel; Methods and Cost of Travel; Distances; Suggestions to Immigrants, etc., etc.

Each regular subscriber to the SCIENTIFIC PRESS and those purchasing single numbers on the day of issue will be entitled to one copy free of charge. Extra numbers will be sold at 15 cents per copy, or \$10 per hundred, and will be mailed to any address on receipt of remittance by Post Office Order or otherwise.

All persons desirous of promoting the growth and development of California, and wishing to communicate facts to their Eastern or European friends, can, at a trifling cost, avail themselves of the present opportunity.

A limited number of ADVERTISEMENTS will be inserted at reasonable rates.

DEWEY & CO.,

Publishers Scientific Press, 414 Clay Street.

San Francisco, July, 1870.

Mann's Patent Earthquake (and Fire) Proof Chimney.

This invention affords a real improvement, which is much needed in this section of country, and as it is just as cheap, can be built more quickly, with less trouble and always perfect, it is very desirable and likely to supersede the old style of chimney.

The chimney is constructed entirely of metal. The lower portion, made of cast, sheet or hollow iron, with a proper opening for a fire-place (which may be built of brick), is of any suitable shape and is intended to rest upon any foundation or upon the floor. If desired, as the whole weight of the chimney will not exceed six or seven hundred pounds. The left-hand figure shows the general appearance of this lower portion. On the right is the chimney-flue, shown in section also, in the middle figure, and below this, is the cover for the lower portion.

The flue is cylindrical and consists of two pipes, one inside of the other, with the annular space between them filled with cement, plaster of paris, asbestos, or other non-conducting material. This flue is secured to the cover, which is fastened to the lower portion of the chimney by rivets or other proper means. The illustration shows the device with one fire-place and one flue. But it can easily be constructed for two fire-places, opening into adjoining rooms on opposite sides of the chimney.

The chimney may be placed directly on the floor, if necessary, and any suitable fire-proof fire-place can be constructed in the recess in the lower portion. Heating stoves may be connected with it at any point, and thus the heat is utilized for warming rooms to a very great extent. It is so light that it is quite applicable when a fire-place is needed only in the upper story or stories of a building. The exposed part of the iron can be painted so as to represent brick-work, or ornamented as desired.

Besides this possibility of a cheap and easily-constructed chimney which can be placed in any room, are to be added its fire-proof qualities. As the pipes are made breaking joints, there is no danger of fire should the chimney be racked. This is a point of no small importance.

It cannot be shaken down by an earthquake unless the house comes down with it. It is absolutely fire-proof, as it is impossible by this construction to have such a thing as a defective flue. It does not take up one-half the room of a common chimney.

These chimneys can be constructed of different sizes and styles and kept on hand for sale, so that they can be ordered and set up at once, greatly facilitating rapid building in the country or city.

The inventor offers part of the patent right for sale. He will contract for chimneys on liberal terms.

Address the inventor and patentee,

2v21-1m

BENJAMIN F. MANN, Oakland.

DESIGNS AND PLANS

— FOR THE —

NEW CITY HALL

— OF —

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted.....\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

ELLWANGER & BAR RY,
ROCHESTER, N. Y.

Reading for the Hour.

Duration of Late European Wars.

In the Crimean war of 1853-6, Turkey declared war against Russia October 5th, 1853. Russia declared war against Turkey November 1st. France and England declared war against Russia March 27th and 28th, 1854. The battle of Alma was fought September 20th; battle of Balaclava, October 25th; battle of Inkerman, November 5th. Sardinia joined the allies January 26th, 1855. The Malakoff was taken by the French September 8th. Sweden joined the allies November 21st; and hostilities were suspended February 29th, 1856. The wars between the Western Powers and Russia lasted two years looking one month.

The Italian war of 1859 was begun by the rejection of the Austrian ultimatum by Sardinia April 26th. The Austrians crossed the Ticino April 27th. The French entered Genoa May 3d. The battle of Montebello was fought May 20th; battle of Magenta, May 30th and 31st; and the battle of Solferino June 24th. The peace of Villafranca was signed July 11th. Hostilities were active but ten weeks.

The Schleswig-Holstein war of 1864 began by the invasion of Schleswig by the Prussians February 1st. The Prussians took Duppel April 18th, and Alsen July 9th. The treaty of peace between Denmark and Germany was signed at Vienna October 30th. Actual hostilities covered a space of twenty-two weeks.

The German Italian war of 1866 was begun by Prussia June 14th. Italy declared war against Austria June 20th. The battle of Custoza was fought June 24th, and the battle of Sadowa July 3d. The treaty of peace between Prussia and Austria was signed at Prague, August 23d, and between Austria and Italy at Vienna, October 4th. Actual hostilities between the belligerents lasted only five weeks.—*Ex.*

"Scissors."—Last night, Mrs. Lynch, a resident of Bank street, near Washington, and her alleged daughter-in-law, Mary, sat in opposite corners of a Sixth Avenue car, apparently very much displeased with each other. To the passengers nearest to them they related their domestic grievances. Mrs. Lynch is a woman about sixty years of age, and her alleged daughter-in-law, Mrs. Lynch, Jr., appeared to be not many years younger. From the story of the two women, it appeared that the younger woman had been married before, and that five years ago her husband died, leaving her with three children to care for. She recently married the son of Mrs. Lynch, alias Mrs. McGuire, but they did not live happily together, and he left her a few days ago. Yesterday she called at her mother-in-law's residence, determined to stay there until her husband should return. The matron of the house decided otherwise, and, locking up her door, took a ride to Central Park. Mary also took a ride in the same car, and to the same place. They returned together to Vesey street, and then started up town again on a Third Avenue car, and they had made twelve trips in this way, up to eight o'clock, and at that hour were determined to keep it up all night if necessary.—*N. Y. Tribune.*

A CALIFORNIA GLACIER.—In yonder mountain valley is a vast body of ice, slowly seeking a lower level and warmer climate, and grinding to atoms the huge ramparts of rock on either side of it. Centuries pass, and though its progress has been but little, its work has been wonderful. On and on it marches, till the warm winds of the plain sweep up to it. Here the hot sun greets it. It eats into the bold front of the glacier, until it changes its form and pace. Meanwhile a river is making, which feeds the speed of the huge monster that formed it. Lower and lower, the glacier creeps; higher and higher, the river rises. It grows with the day; it grows with the night. It becomes a stranger to all manner of decorum. It springs again and again at the rocky sentinels above it, and finally crumbles them into its bosom. It uproots the trees that stand in its pathway. It scars the breast of the mountains with its terrible iceberg batteries. It licks up the soil of the smaller valleys, and deepens that of the larger ones. It dashes through the narrow gorges, changing into boulders the huge rocks that oppose its progress. It is everywhere king, everywhere madman, everywhere a power for new and radical changes.—*Overland Monthly for August.*

THE CROMWELL OF THE NEW WORLD.—At the Garita de San Cosmo, the stern old champion of Republicanism, the man of many adventures and the most wonderful history, and most varied fortunes, the man of the iron will and indomitable resolution, which stood out on every feature, the man with the charmed life, who has escaped unscathed from more plots, conspiracies and accidents, than any other man now living; the man who will live in history as one of the wonders of our age; the man sent by Providence to repel foreign invasion, crush and destroy the despotism of the church, free the people, establish schools, suppress insurrection, deal the last blow at imperialism in America, and rule a turbulent nation with a rod of iron—the citizen President Benito Juarez, stood waiting to receive the nation's guest. He was dressed in plain black, and had not even a liveried servant in attendance; his wife and daughter accompanied him. The brief friendly greeting over, and the other members of our party having been introduced by Señor Bossero, the cavalcade resumed its way and entered the capital city of the Republic.—*Albert S. Evans.*

A MAN LOSES HIS WIFE AT CARDS.—About eight or nine months since a man living in the northern part of this city went out into the northern part of the State to seek his fortune in the new mines of that section, leaving his wife and one child here in town. Some seven months ago a gallant

TOO FOND OF PICTURES.—After the Canada Illustrated News.

disciple of St. Crispin persuaded the White Pine widow to take up her abode with him in a house which he furnished for her. The new pair lived together for about seven months, when a few days ago the genuine husband returned. Of course there was trouble in the camp, but after some quarreling the two men agreed to play a game of seven-up for the woman. The game came off last Saturday night, and the husband won his wife back by just "two points." The man claimed his wife, and the man of leather could not say but that he had fairly won her. The woman preferred the shoemaker, but the husband and winner was determined to have his own. He packed up what furniture they possessed, and last Saturday evening, with all his household goods and gods, left by a fast freight wagon for California. When the wagon started from North C street there was quite a scene. A crowd of nearly 100 persons had collected to see the husband carry away his "stake," and there was much merriment over the romantic affair. The woman cried, and wanted to stay with the shoemaker, and the shoemaker cried at parting with the treasure he had lost by not holding enough "trumps." He asked some of the crowd if they thought he would be arrested if he attempted to take the woman out of the wagon. They told him he had lost her "on the square," and he must bear it like a man; so the wagon moved on, and soon the fair one was "gone from his gaze."—*Territorial Enterprise.*

ANOTHER JUBILEE.—Mr. S. Bngbee, originator of the festival for the benefit of the Mercantile Library, and Mr. Levy, the famous cornet player, propose a novel musical jubilee, to be held at the Pavilion, if allowed. Among the items proposed are:—lighting the building with a thousand Chinese lanterns; baying a fountain of Cologne water, illuminated by an electric light; an orchestra of 35 pieces under the direction of Mr. Levy; etc., etc. Four concerts are to be given; one half of the profits are to go to the S. F. Benevolent Association, and the rest to other charities.

CONSUMPTION OF BEER IN EUROPE.—It is estimated that the quantity of beer consumed in Europe each year would require to contain it a canal nearly five English miles in length, 50 feet deep and 200 feet broad. Germany drinks 121,500,000 gallons of wine and 446,600,000 gallons of beer. Great Britain and Ireland consume 728,200,000 gallons of beer, and France, 600,000,000 gallons of wine and 151,800,000 gallons of beer.

On the Bavarian border is a little village—Heiligen Ehesdorff—of 1,000 inhabitants. In this village the yearly consumption of beer amounts to 536,804 quarts, or nearly two quarts per day to each inhabitant. Heiligen Ehesdorff supports three inns and twelve beer saloons, or one to every sixty-six of the population. It is the champion beer-drinking town of the world. Their beer costs its inhabitants eighteen thalers each per year.

Some of the German names for beer and for its distinctions and varieties are amusing. Village devil, belly-ache, shaky head, shaky cap, mule, death-blow, death-head, peace and unity, cool blonde, clack, god-down, cuckoo and buffalo, are among the appellations.—*American Eclectic Medical Review.*

WOULDN'T COME OUT.—The chairman of an Iowa vigilance committee, who was instructed to duck a person, whose acts had made him obnoxious to the community,

San Francisco Prices of Copper Ores.

SAN FRANCISCO, July 21, 1870.

W. T. Atwood states the following as the approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton	Per cent.	Per ton	Per cent.
12 per cent. ore.....	\$24 00	18 per cent. ore.....	\$41 40	
13 " " " " " " " "	26 65	19 " " " " " " " "	44 65	
14 " " " " " " " "	29 40	20 " " " " " " " "	48 00	
15 " " " " " " " "	32 25	25 " " " " " " " "	82 50	
16 " " " " " " " "	35 20	30 " " " " " " " "	75 00	
17 " " " " " " " "	38 25			

Ores assaying above 30 per cent., \$2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

THE JURY failed to agree in the important patent infringement suit, between Treadwell & Co. and Baker & Hamilton, concerning the patent rights on the Huie and the Sursa Gang Plows.

A new serial story by a distinguished American writer, whose name is held in reserve, is to be begun in the August GALAXY. The tale is said to be full of incident, dramatic, novel in scene and character, and admirably adapted for serial publication. j330

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills Brick Lane, London. 5v20-1y

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which make the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—*New Age.*

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

LAYERS' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

And in accordance with law and an order of the Board of Trustees, made on the eighth day of June, 1870, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the salesroom of Maricopa Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the first day of August, 1870, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HENRY R. REED, Secretary. jy16.

Office, 321 Washington street, San Francisco. jy16.

Evening Star No. 1 Silver Mining Company,—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of June, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the second day of July, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of July, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery street, San Francisco, California. jy16.

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until the first day of August, 1870, and the sale thereof until Wednesday, the twenty-fourth day of August, 1870. By order of the Board of Trustees.

W. H. WATSON, Secretary.

Globe Gold and Silver Mining Company.

NOTICE OF ANNUAL MEETING.—Location of Mine and Works: Monitor District, Alpine County, California. Notice is hereby given, according to law, that the ANNUAL MEETING of the Stockholders of the Globe Gold and Silver Mining Company will be held on Tuesday, the 2d day of August, 1870, at 4 o'clock, P. M., of that day, at the office of the Company, No. 481 Bryant street; the object of the meeting being to elect Trustees for the ensuing year, to serve till their successors shall be duly elected and qualified; also, to set upon a proposition to remove the office of the Company to Monitor; and for the transaction of such other business as may come before it. By order of

J. WINCHESTER, President.

B. SHRAFF, Secretary pro tem.

Dated San Francisco, June 30, 1870. 1m.

Latawana Mining Company—Near Hamilton City, White Pine, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of June, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

LEA & PERRINS' WORCESTERSHIRE SAUCE.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their name inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see names on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-lyeow

DR. ABORN

Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Auzeiras House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oak-

DR. ABORN.—I take pleasure in hearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.

Oakland, June 3, 1870.

WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patient to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon. James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Coffie, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hartwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1v21-2m

HOWLAND PATENT ROTARY BATTERY

of 12 stamps. It requires no frame to put it up. Guaranteed to crush 1½ to 3 tons per day to the stamp. The best Battery ever used for amalgamating gold, or crushing silver ores, dry or wet. METHUEN, MASS.

Particular attention given to Wheels for Portable and Fire Engines.

All my Wheels have my name cast on the hub, and are made by my Patent Press Process. By this new method the wheel is so compressed in every part that shrinkage or yielding of the part with all its attendant evils is wholly obviated, even in the driest climate. Any one understanding my process will be convinced of this. Send for illustrated circular. 20v20

E. A. ARCHIBALD.

GIANT CEMENT.
GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimony. Also, MINERS' RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both CEMENTS are put up in TIN CANS ONLY, with full directions. Take no other. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT.

MINERS' RUBBER CEMENT.

ORANDALL'S PATENT SPRING BED.

COOLEY & GREEN, Proprietors.

Manufacture, corner Front and M streets, SACRAMENTO These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. Orders received at our manufactory, or at our agencies, as follows:

S. B. SNEDAKER, 413 Pine street and 539 Market, near New Montgomery.

W. H. SABLE, San Jose.

MR. NICHOLS, Stockton.

IRWIN & GARNETT, Oakland.

MR. MURPHY, Vallejo.

E. A. TOMPELINS, Grass Valley.

E 22v20

WM. H. MURRAY, whom we mentioned some time since as agent and correspondent of the Scientific Press, has returned from the North where he was very successful in introducing the Press in the mines. The fact is now fully known and appreciated that the Press is the only reliable mining paper published in the United States. The Eastern mining papers are simply guess work, while Messrs. Dewey & Co., being practical and scientific miners, know whereof they write, and are authority. They are No. 1 patent solicitors, likewise. In this department they are the Mann & Co. of the Pacific. Mr. Murray has been as far north as Idaho City, and after visiting Eureka, Mineral Hill and Railroad districts, will go east as far as Salt Lake and canvass among the Utah farmers. The paper contains an able agricultural department.—*Elko Chronicle*, July 7th.

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,
Or of the WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use the Wilson Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
F. R. WILSON,

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining, and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

Patented Nov. 1st, 1864, July 24, 1866, and Oct. 9, 1866.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Atna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Crut Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and farther information, address

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

PAIN KILLER

PROF.

PENNY DAVIDSON

PROVIDENCE, R.I.

1840 1870

The Great Family Medicine of the Age.—THIRTY YEARS have elapsed since the introduction of the Pain Killer to the public, and yet at the present time it is more popular and commands a larger sale than ever before. Its popularity is not confined to this country alone; all over the world its beneficial effects in curing the "ills that flesh is heir to," are acknowledged and appreciated, and as a PAIN KILLER its fame is limited to no country, sect nor race. It needs only to be known to be prized.

THIRTY YEARS is certainly a long enough time to prove the efficacy of any medicine, and that the PAIN KILLER is deserving of all its proprietors' claim for it is amply proved by the unparalleled popularity it has attained. It is a sure and EFFECTIVE remedy sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directly accompanied each bottle. 4v21-1m

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematics, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY and MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING and METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY and GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 7v15-15p

THE SCIENTIFIC PRESS.—Mr. W. H. Murray, special traveling agent for the Scientific Press, is a very sociable and pleasant gentleman. He speaks in high terms of the mineral resources of Owyhee, and predicts for our camp a bright future. After examining the mineral and agricultural resources of Idaho, he will proceed overland to Montana and Colorado. He has secured quite a large list of subscribers for the Scientific Press, which is devoted to mining, farming and the mechanic arts, and is inferior to no publication of the kind in the United States.—*Avanlanche*, June 18th.

ROASTING OF GOLD AND SILVER ORES,

— AND THE —

EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

By G. KUSTEL, Engineer and Metallurgist; author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of All Kinds of Ores." 145 pages, 12mo.
Illustrated by Numerous Engravings.

TABLE OF CONTENTS.

I. INTRODUCTION.

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chlorine.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Changes in Roasting.
B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverse.

ratory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimneys and Flues.

III. EXTRACTION OF SILVER BY LIXIVATION.

O. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patena Process; Kloss Process; Patena and Roszner Process; Kustel and Hofmann Process; Augustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arsenurets.

Published and sold by DEWEY & CO., SCIENTIFIC PRESS OFFICE, 414 Clay street, San Francisco. Price, \$2.50 coin, or \$3 currency. Postage, 12 cents extra.

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for drying, and can be folded as compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent of State Rights for sale cheap.

A NEW CORK EXTRACTOR.

This is a simple device of practical utility. It is adapted for Hotels, Saloons and family use. The tightest cork can be drawn with a mere nominal outlay of strength, and without any risk of bruising or hurting the hands. They will be furnished, plain or silver-plated, at manufacturing cost, to parties purchasing Rights. Any person of energy can soon realize the cost of a State Right by selling the Cork Extractors, as they sell readily and afford a large profit. Send for circular.

NEW LIGHT ON A NEW PRINCIPLE.

Gas for everybody in the city and in the country. Equal to coal gas at one-half the cost. The gas is generated and burned in a new style Vapor lamp. No wick, no chimney, no explosion, and no man who is out of business and has a few dollars should fail to purchase a County or State Right and commence making money. Parties owning territory get the Lamps at Manufacturer's prices. Call and examine the light, or write for particulars.

STEAM COOKER.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

SWIMMERTON'S MECHANICAL MOVEMENT.

Every steamboat should have a Pilot made on this principle. It is particularly adapted for the application of power to Steam propellers. Send for circular.

WIESTER & CO.,

314 Bush Street, San Francisco.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersen Works, London.

THE MOROAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs A. S. Hallidie & Co., Agents Morgan Crucible Co.:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. R. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

J. M. ECKFELDT, Melter and Refiner, U. S. R. Mint, 12th March, 1869.—Messrs A. S. Hallidie & Co., 519 Front street.—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE, Messrs A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WOOD & CO., California Brass Works, 125 Front street, San Francisco Assay Office of H. Harris, Silver City, Nevada, April 23, 1869.—Messrs A. S. Hallidie & Co., Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adams, Gander, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or triple the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS. On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

519 Front street, San Francisco

RIDER'S GOVERNOR CUT-OFF ENGINE

Manufactured by the DELAMATER IRON WORKS
West Thirteenth St., New York. The prominent
uses of this engine are: Economy equal to any; regulation of speed by cut-off; entire absence of
or complicated mechanism; simplicity of design;
non-liability of derangement; requiring no more
than common engines. NOTE.—This improvement
has been applied in many cases to existing engines. Pam-
phlets sent on application. 26v20-3m16p

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, August 6, 1870.

VOLUME XXI.
Number 6.

The Hydraulic Ram.

Comparatively few persons are aware of the large number of these little, useful, labor saving machines, which are constantly pounding away, day and night, all over the country, turning small streams of water out of the channels which nature designed they should traverse, and forcing it up through artificial veins and arteries to elevations accessible at all times to the wants of man. Owing to the naturally obscure location of springs, and the necessity of the ram being placed below the surface of the ground, they are seldom noticed by persons passing through the country; yet there are hundreds of them, at the present moment, working away in neighborhoods where the land is sufficiently rolling, and where springs abound with sufficient fall to work them.

The principle of the ram was first discovered by a Frenchman by the name of Montgolfin, about the year 1796; but they were not introduced into this country until about the year 1845, at which time a great improvement was made in the manufacture of small lead pipes, which seemed nicely adapted to the ram, and which aided very much in bringing it into more general use. Instances are quite numerous, (when they have been properly put in and all the circumstances are favorable,) of their having been working for over twenty years with comparatively very little expense; and there is no reason why they should not continue so to work for twenty years longer.

Like everything else the rams have been gradually improved, from year to year, but recently A. Gawthrop & Son, of Wilmington, Delaware, have made a specialty of manufacturing them.

They have improved the mode of casting so as to insure them all perfectly sound. They have introduced strong malleable iron keys and bolts, in fastening them together, instead of screw bolts, which are so liable to rust and get out of order. The gaskets, in forming the joints are all made of gum and sunk in grooves, so as to prevent their being drawn out of place by the force of the ram. Their machines have become very popular. Any further information concerning them can be obtained by addressing A. Gawthrop & Son, Wilmington, Del.

DEATH. Dr. D. W. C. Rice, formerly of Marysville, well known as former President of the California Pacific R. R. and a most excellent man, died this week.

STATE UNIVERSITY.—At the meeting of the Board of Regents on Tuesday, it was announced that Prof. Gilman declined the Presidency of the University; that the Committee on the Medical Department reported favorably with regard to the Toland Medical College; that Mr. F. L. A. Pioche presents to the University his ex-

Our Visitors.

Among the many parties which have visited our coast this summer, none has been more welcome to us than the last, the "agricultural" one, which arrived here last week. Coming as representatives of the leading Eastern journals, which devote a

view of things without borrowing our glasses to look through. They will go back and make their various reports to the East. California will be treated of as it has actually appeared to them. Of course we shall be interested in their reports, and of course we shall hope to see them as favorable as possible.

Our only subject of complaint would be that we fear that they will not stay here long enough. California is so large, and has such varied climates and productions, that to do her justice, one needs to spend considerable time here; and, besides, California, is but a part of the coast. But while they are here, we hope to make the best of them, and desire that their trip may be made as pleasant and instructive as possible. The following are the names of the excursionists and the respective journals which they represent:—

H. L. Reade, Ag. Ed. of *Hearth and Home*, New York, *Chairman*; J. B. Lyman, Ag. Ed., *N. Y. Tribune*, New York, *Secretary*; Mrs. J. B. Lyman, "*Kate Hunnibee*," of the *Hearth and Home*, New York; Henry T. Williams, Editor of *The Horticulturist*, New York, and Ag. Ed. of *The N. Y. Independent*, *Treasurer*; X. A. Willard, Dairy Editor *Rural New Yorker*, New York, and Vice Pres. Am. Dairy-men's Association; S. R. Wells and Wife, *American Phrenological Journal*, N. Y.; F. D. Curtis and Wife, *Troy Times*, and Vice President N. Y. State Agricultural Society; Hon J. V. C. Smith, ex-Mayor of Boston, P. T. Quinn, Horticultural Ed. *N. Y. Tribune*, Prof. J. A. Whitney, Ed. *Am. Artisan*, A. B. Crandell, Ag. Ed. *N. Y. World*, Com. from the N. Y. Farmers' Club; A. T. Emery, *Prairie Farmer*, Chicago, Ills.; Judge S. B. Noyes, *Mass. Ploughman*, Boston, Mass.; Mrs. S. O. Johnson, *Country Gentleman*, Albany, N. Y.; W. Steadman, *Norwich*

Advertiser, Norwich, Conn.; S. Higgins, *Norwich Bulletin*, Norwich, Conn.; J. M. Dodge, *Newark Register*, Newark, N. J.; Prof. A. Poey, Cor. *Rural New Yorker*, New York City. A hearty greeting to them all,

THE HYDRAULIC RAM ARRANGED IN PLACE FOR RAISING WATER.

tensive and valuable collection of minerals and a number of rare and very costly pictures. The Committee on Library was instructed to make arrangements for a pub-

lic reception of the donation and for returning thanks in a proper form for the magnificent gift of Mr. Pioche. Resolutions were adopted with regard to library matters. A letter was received, urging that Bret Harte be appointed Librarian.

THERE are in America and Europe more than 250 manufactories of India rubber articles, employing some 500 operatives each, and consuming more than 20,000,000 pounds of gum per year.

part or all of their columns to matters connected with the farming interests, their advent is no unimportant one for our coast. They have been looking around the country this last week, in a quiet way, and in small parties. They seem disposed to get a

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Mineral Hill District, Nevada.

[Written for the Scientific Press.]

Palisade Station.

EDITORS PRESS:—I promised your readers that I would give a description of a trip I intended to make to the Mineral Hill and Eureka districts, and to let them know what was going on there. In traveling thither, one leaves the railroad at Palisade station, which is about 33 miles west of Elko. Here all the trains stop and connection is made with Woodruff & Ennor's stages which run to White Pine.

Palisade station is destined to be a very important place. Of this the railroad company is aware, and is enlarging the freight depot and affording many facilities for the forwarding business. I am informed that 75 tons of base bullion were received here in June alone from Eureka, and it is thought that the amount will be doubled this month, and swelled almost without limit by the ore shipments from Secret Cañon, Pinto, Eureka, Mineral Hill and Railroad districts, of which places this is the natural outlet; and it will likewise be helped in its growth by the agricultural interests of Pine Valley, already quite considerable. Wells, Fargo & Co. have their express office here and a post office has been established.

I cannot omit mention of the natural beauties around Palisade. Here the Humboldt river runs through a narrow gorge, with the rocks rising perpendicular on each side to a height of 500 to 1000 feet, and even higher. The scenery is really magnificent and deserves all the praise which has been given it.

Stage Lines.

I send you a rough diagram intended merely to denote the relative position of the places here and the lines of communication. The stage line of Paine, Russell & Co. runs from Carlin as far as Eureka, three times a week. Between Carlin and the junction of their road with the one from Palisade, however, the country is hilly and the hauling difficult, while the road from Palisade is not only level but also much shorter. On this road run daily the stages of Woodruff & Ennor, which continue on through Mineral Hill and Eureka to White Pine, a distance of 120 miles and on the pleasantest route, according to common report, which exists in the State. Certainly the road up Pine Valley is a very pleasant one. This valley contains a large amount of meadow land, is well watered by Pine creek and near its centre is a tract of 2,500 acres of marsh, covered with tule growth. Of the gentlemanly proprietors of the Woodruff & Ennor line, and their attention to the comfort of travelers, I have previously written. Having again passed over their line, I am all the more ready to recommend it. The firm is most excellently represented here by Mr. W. B. Daugherty, one of the best of agents.

Railroad District.

About six or eight miles east of a point some nine miles from Palisade is situated Railroad District. As I could not conveniently get any conveyance thither, and was pressed for time, I did not visit the mines. Here, as I understand it, copper is the predominating metal, the amount of silver being comparatively small. Still the ore is rich enough to pay for shipping and the place is growing in prosperity. There is a smelting furnace erected here, but this is not working at present. I have favorable reports concerning the mines from persons who are supposed to be conversant with the state of affairs.

Mineral Hill.

Leaving Pine Valley, in which the road runs for some 31 miles from Palisade, we follow up a long cañon, with grass-covered slopes, and enter the town of Mineral Hill. This now flourishing camp was discovered in June, 1869, by Jas. Ward and D. R. Northey. These gentlemen, in company with D. McDonald and John Sheehy, located a number of ledges on the hill and started the mining district, of which Mr. Northey was Recorder at the time. They took, in the beginning, 2,250 pounds of ore to the Austin mill, which yielded at the rate of \$555.75 per ton. This came from the Live Yankee ledge.

The hill is beautifully wooded with nut-pine and cedar, and hence fuel can be obtained at the rate of \$4.50 per cord. The cañon in which the town is situated, is well-supplied with water. That the climate is healthy is attested by the fact that not a single death has yet occurred here, which fact is also indicative of a peaceful disposition on the part of the inhabitants, who number somewhere about 300 persons. Originally tena, "wickiups," and holes in the ground furnished habitations to the miners, but good, comfortable buildings are now being erected.

The formation is slate and limestone, but all the mines hitherto discovered are in the lime-rock. This forms a capping over the slate, which latter reaches nearly to the summit on the eastern, but appears some 300 feet below it on the western side of the hill. On the northern side the slate extends up a distance of some 350 feet above the town. Several tunnels have been run in the slate to strike ledges—one, the Grass Valley, near the city, is in some 145 feet; at a distance of 125 feet the slate

(which at the surface is of a brown color) is as black as coal. Another tunnel, 200 feet higher up the hill, has been run in 103 feet. Small bodies of quartz have been struck, but no ore as yet.

The ore comes in bodies or veins, from five to forty feet wide, on the ridge and throughout the limestone. The direction of the individual veins is north and south. How deep down they extend and whether they penetrate through the slate, no one knows definitely as yet, for the deepest shaft is not over 50 feet down and is still in the limestone. No fossils have been found, I may here remark, in this locality, as far as I can learn. The ore contains considerable galena and is very rich. I send you a number of specimens, and likewise a copy of the results of working a number of lots of ore at the Austin mill and at Reno. You will observe that the amounts worked are large enough to be fair samples, varying from 2,120 to 17,526 pounds; and that the average of the fifteen lots is a little over \$515 per ton.

Mineral Hill M. Co.

The early prospectors formed a company, known as the Mineral Hill M. Co., which own the principal mines and have some forty locations, all of which are on the western slope and are included within an area of half a mile. There is a good wagon road, now being built, for hauling ore to the mill. The company employs some 25 men in extracting ore and have now a large amount on the dump.

The Live Yankee, the pioneer mine, is situated about the middle of the ridge and shows a large amount of fine looking ore on the dump. Next to this is the Gray Eagle, where, however, not much is now going on. The Silver Queen is in a large body of ore of extremely fine appearance. The Giant shaft is 53 feet deep. This was sunk to strike the Giant mine, but in sinking, the Give Out mine was tapped, and drifts run 20 feet each way on the lode, which had apparently good walls. The ores assay finely. There are 150 tons on the dump, and the ore worked at Reno netted \$390 per ton. The Giant mine has 100 tons of high-grade ore on the dump. This has a very large body of ore which averages in the mill about \$100. The Star of the West, near the last, has a shaft 45 feet deep and ore of about the same quality. But a lot of 14 tons has been shipped which yielded from \$700 to \$900 per ton. Keeping on the ridge still, we get to the Mary Ann, with a shaft 28 feet deep, and 100 tons of ore on the dump, ore which will yield upwards of \$500 in the mill, and I was shown some 12 sacks which I was assured would yield nearly \$2,000. The above mines belong to the Mineral Hill company.

Other Mines.

The Austin mine is owned by J. C. Crombie, A. Plummer, J. McCabe, Wm. Flemming, and J. Spencer. It is located on the summit of the mountain, and contains a large body of ore, which is worked like a quarry. The whole face of the cut, which is now about 35 feet high and upwards of 10 feet wide, shows good milling ore. There are some 300 tons on the dump, and 22½ tons (which were hauled 90 miles to Austin, and hence, perhaps, sorted a little more carefully than if they were to be milled in the district) gave \$650 to the ton. This company owns also the Spencer mine, on the east side of the hill, where there is a body of ore 12 feet thick, and an incline already 20 feet down. Fifty tons of fair ore are on the dump. The Western Slope, with a shaft 20 feet deep in first-class ore, and the Troy South, with \$300 to \$400 ore, are likewise owned by Spencer & Co.

The Ogden mine, owned by Curtis & Huber, has a shaft twenty-five feet down in a solid body of smelting ore which contains a large amount of lead, and assays \$70 to \$180. The Capella, owned by Malley & Co., is on the western side, contains considerable iron and lead, and assays well. The McIntire, located in July, 1869, and situated on the north side of the hill, contains good ore, yielding \$200 to \$250 in the mill, but is not worked at present.

Most of the above mines are getting along finely. They are all crowded into this small space, which is certainly remarkable for its abundance of good ore. Outside of this district there are but few mines, and these do not appear to be very rich.

A Custom Mill.

Messrs. Curtis & Huber, the well known millmen from Austin, who have been closely watching the development of this district, have concluded to erect a mill and a Stetefeldt furnace. Through the kindness of Mr. John Huber, I was conducted through the works, which are rapidly approaching completion. They were commenced on May 6th, 1870. The main building will be 137x108 feet, and will have 10 stamps and provisions for more as they are needed. The engine, made by Booth & Co., will be of 80-horse power, with a boiler 15 feet long and 54 inches in diameter, and containing 68 tubes. There will be six Wheeler pans and three large settlers.

The furnace is being built under the supervision of Mr. C. Weberling, who appears fully competent for the business. There will be used 200,000 bricks, 11,000 pounds of castings, 4,000 pounds of wrought iron, and 4,000 pounds of machinery—the iron work being furnished by Booth & Co. The stock will be 75 feet high, and to reach this the dust, etc., will have to travel from the fire-place upwards of 400 feet. The right for this district to use the furnace cost, I should judge, \$20,000; the erection of the furnace, \$12,000; and the whole cost of the mill and furnace must amount to about \$60,000. There will be thus a capacity of working some 20 tons daily, at least; some say from 30 to 40 tons. The charge for milling will be \$35 per ton, the ore being worked up to 85 per cent. of the assay value. The whole affair, in the hands of Messrs. Curtis & Huber, will be made first-class, and their erecting such a mill speaks well for the prospects of the place.

Neighboring Districts.

Some fifteen miles west of this camp are the counties, district and range of mountains, and to the east is the Inskip range. Two miles to the south is Cave Hill, where there are a few locations. The name is derived from a fine, large cave, containing beautiful stalactites.

About four and a half miles to the southeast lies Railroad Hill, where I understand there are some very promising locations, although the ore is of rather a low grade. Still farther on south of the last place is a new camp known as the King District, where copper predominates.

About twenty-six miles due north is situated Railroad District. This is a few miles from the Central Pacific Railroad, and is reached from Palisade Station.

Off for White Pine.

Leaving Mineral Hill on Woodruff & Ennor's line, we proceed on to Eureka, a distance of 52 miles. We started at 10 p.m., and traverse a good road, judging from the easy motion of the coach. At daylight we reach Sulphur Springs, whose name is sufficiently indicative of its chief attraction, and get to Eureka in time for breakfast. [We have a special communication concerning this district.—Eps.] The through passenger has here thirty minutes for breakfast at the Parker House, which is kept in good style and is exceedingly neat and comfortable,—so much so that one is greatly tempted to lay over here. Should one decide to do so, he will be amply repaid. The district is worth a visit, and Mr. Parker knows well how to make the stay most agreeable. Having learned from experience that it is most useful to the traveler to know where is the best place to put up, I have no hesitation in warmly recommending mine host Parker and his excellent hotel.

After breakfast the coach rolls on to Hamilton. When, by easy grades, we have arrived at the summit of the road over Diamond Mountain, we have a charming view of the mountain ranges, the most prominent being the White Pine range, and the intervening valleys. Fourteen miles from Eureka we come to Pinto, now developing to a place of considerable importance and promising well. Thence, without further stop, we keep on at a rapid trot until we reach Hamilton. And so we have made our trip from Palisade over the pleasantest route I know of in this State, and in as comfortable coaches as I have yet tried. This is the route and the stage line to take if one wishes to see some of the most important mining camps, best accommodations and finest scenery in Nevada.

Idaho Territory Correspondence.

[Written for the Scientific Press.]

EDITORS SCIENTIFIC PRESS:—In compliance with your request, I will endeavor to furnish such items of news from time to time, concerning this section, as may seem to be worthy of public note abroad, and with this view send you the present communication. It may contain a few items, probably you may consider them "news" of sufficient interest for the readers of the SCIENTIFIC PRESS. Your correspondent makes no pretensions whatever to scientific knowledge or attainments, and hence contracts to do no more than to send such facts and occurrences and descriptions and statistics, as are falling under his observation and coming to his knowledge in other than a scientific guise, technically speaking.

Quartz Mining.

The present mining season in Boise county, is nearly over for bill and har mining claims, but is usually open until winter sets in, in the creek claims. Heretofore Boise Basin, the great placer mining camp of the county, has attracted but little attention except for its placer gold deposits. These have been so rich, extensive and productive, yielding more millions of dollars in gold dust, than has been officially credited in U. S. Government Reports to all Idaho Territory, in the years 1863, '64, '65, '66, '67, '68 and '69, that quartz mining has received comparatively little attention. A few lodes have been partially developed, and have been profitably worked, among which are the King, Specimen and Mammoth lodes on Summit Flat, above Pioneer City; the Elkhorn, near Pioneer City; the Pioneer Lode on, Granite Creek, and a few others. In the Banner District several fine, well defined ledges have never yet been worked at all, owing to want of capital on the part of the owners, and no mill has yet been erected there for crushing rock. Within a few years, this district, situated about thirty miles northeasterly from this city will be adding very materially to the productive wealth of the country. The Yellow Jacket company, recently organized, are putting up a ten stamp mill upon their lode, some two miles above Granite Creek village, and expect to be able to commence crushing rock by the middle of September next. They have nearly 1,000 tons of fine rock already out of the ledge, ready for crushing, and confi-

dently anticipate very profitable results. The Pioneer company are working their ledge and mill with favorable results. The King mill on Summit Flat has been in operation only a part of the season, but with good results. These three are the only quartz mills at present being operated or preparing for work in the county. The day of quartz mining in fact, is only just arriving in this new country. The day will come when Boise county quartz will give a good account of itself, and yield immense fortunes to men engaging and investing in it.

Placer Mining.

Some of the placer claims of this county have paid better this season than ever before, but the majority of them only moderately well. One obstacle the miner has to contend with, is the high price of water charged by the ditch-owners, which prevents the mining of large areas of good mining ground as yet. Like the old placer mining camps of California, Boise Basin is gradually being exhausted, though as in Nevada county, California, the creek claims are yearly increasing in value by the "tailings" from the high bars and hills adjacent, which are annually deposited in the creek claims. Bed rock flumes will sooner or later be constructed, where feasible, which will prove immense sources of profit to the owners. Twenty miles in length of such a flume of proper size in More's creek below this city would be worth millions of dollars.

Weather—Agriculture.

The extremely hot weather of this summer, prevailing so distressingly almost everywhere in the United States, according to the newspapers of the day, has scarcely made an appearance here so far, there having been comparatively few hot days. The sun now declining southward, and the days gradually shortening and the nights lengthening, the greatest degree of mid-summer heat may reasonably be supposed to have passed, and the nights, always cool and pleasant in the hottest weather, are already growing perceptibly cooler.

In the agricultural districts of this county, and in Ada county adjoining, on the south and west, the crops are abundant.

The grasshopper pest of previous years has not made its appearance the present season, and the acreage of land under cultivation is greater by one-fourth than that of any former year in Idaho Territory. It is believed that breadstuffs, vegetables and, in fact, the products of the soil generally, this year raised in Idaho, will be nearly if not quite equal to the home demand and consumption of those articles and products. From time to time in the future, if acceptable, I will continue this correspondence.

Boise.
Idaho City July 25th, 1870.

THE DANCE OF DEATH.—In the immense Hall of Knights, which occupies the whole length of the western side of the castle, another story relates that the cruel Knight, Sir Strange, one of the first lords, who held the castle in fief of the Crown, caused his daughter to be danced to death by her six rejected wooers, whom she had refused in favor of a poor sculptor who had been sent to the castle to exercise his art in decorating the chapel. Their secret meetings were discovered by one of the rejected lovers, and brought to the knowledge of her father. The proud knight, in his grief and rage at what he deemed the disgrace of his house and ruin of his daughter, ordered the low-born artist to instant execution in the court-yard, and which he compelled the wretched daughter to witness from the window of her room in the turret. The same evening she was ordered to dress herself for a ball, and conducted to the great hall, where she found her father and six knights awaiting her. No other woman was present, and the unnatural parent informed her that these six cavaliers would now test her boasted power of tiring everybody out in a dance. If she succeeded, her life would be spared; if not, she would not leave the hall alive. The dreadful dance of death began, and, it is said, she exhausted her four, and almost her fifth, when the fearful exertion and her panting breath caused her girdle to burst, and she instantly dropped dead on the floor, her heart-blood dyeing the planks, leaving an indelible stain, like that of Rizzio and Holyrood, to mark the spot of her cruel murder.—*Overland Monthly.*

LECTURE.—Dr. Isaac Rowell delivered a very interesting lecture last Saturday evening, in the Mechanics' Institute, on the subject of "Climatic Influences," especially as affecting animal and plant life in the various geological epochs.

Mechanical Progress.

Phosphates in Dyeing.

M. Collas, of Paris, has recently succeeded in using phosphates as a mordant in dyeing and calico printing. To this end, he passes the yarn or the cloth through a weak solution of a phosphate in an acid, and afterwards through a dye bath or an alkaline bath, by means of which the phosphate is fixed upon the fibre: the stuff, after being prepared in this manner, is ready to be dyed or printed with aniline, or with vegetable, or animal colors. The stuff thus prepared may be passed through a solution of tannin before being printed or dyed. Thus, for instance, in order to dye in dark colors, the yarn or cloth is immersed in a warm and clear decoction of one kilogramme of sumac in four and a half liters of water, of from 30° to 40° C., after which, the stuff is wrung out. It is then immersed for twenty or thirty minutes in an acid solution of phosphate of lime of 50° Baumé and when wrung out and washed it is ready to be dyed. Purple, especially, yields fine hues. In order to dye with insoluble colors, the cloth is immersed in a mixture of gelatinous phosphate of lime with a solution of gelatin in water, having a temperature of 2° or 30° C. Cochineal-lake may be prepared in this manner by stirring gelatinous phosphate of lime-hydrate into a filtered decoction of cochineal. M. Alfraise, according to the *Moniteur Scientifique*, believes this gelatinous phosphate to be of great importance.

DOUBLE STEAM BOILERS.—*Engineering* speaks thus of the plan of M. Felix: "The system consists in adding to an ordinary boiler a second boiler so arranged that it is heated by the steam in the first. Thus, in one case, it is proposed to provide the first boiler with a dome of unusual size, this dome being divided horizontally by a plate, from which tubes depend into the steam space of the boiler. The upper part of the dome above the division plate forms, in this case, the boiler from which the steam is drawn for the supply of the engine. The first boiler is heated by a fire in the usual way, but inasmuch as all the steam formed in it is condensed by contact with the tubes of the second boiler, the contained water is evaporated over and over again, and the only fresh supply needed is that required to make up losses by leakage. It is claimed as one of the advantages of the system that inasmuch as there is no renewal of the water in the first boiler (except the slow renewal rendered necessary by leakage) there can be no formation of incrustation on the surfaces exposed to the fire; while on the other hand in the second boiler—where of course incrustation will form as usual—none of the surfaces incrustated are exposed to a higher temperature than that of the steam in the first boiler."

THE ELEVATED RAILWAY.—The *Iron Age* pronounces this a failure. During the occasional intervals between break-downs it has had considerable patronage; few, however, go over it a second time. "It is constructed with but little apparent regard for scientific or mechanical principles; and does not realize in any sense the expectations of those who have furnished the money expended. The method of propelling the cars by means of an accession of endless wire cables is not a success in any respect, as the motion is uneven and disagreeable, and the gradual loss of impetus in passing over the bridges between the sections, necessitates a succession of sudden jerks as the tracks attached to the cables come in contact with the apring affixed to the under part of the car. The worst feature of the road, however, is the weakness of the structure, sustained by single posts, and possessing no side braces or supports to overcome the lateral motion of the heavy cars balanced upon the spreading arms that hold the tracks."

EXPERIMENTS IN TIMBER DRYING.—M. Violette has exposed pieces of several sorts of wood for two hours to steam at 7½ pounds pressure to the square inch, raising the temperature to 480° Fahrenheit, before the experiment was finished. The wood decreased considerably in weight; elm and oak one-half, ash and walnut two-fifths, and pine one-third. It became stronger; oak was increased in strength five-ninths, walnut one-half, pine two-fifths, and elm one-fifth. Maple and pine treated by steam at 487° were, by this process rendered more valuable for musical instruments than is possible by any other known. —*Technologist*.

PYRO-PHOTOGRAPHY.—The following is from the last number of the *Technologist*: "A new and important progress has been achieved, namely, the application of the enamel photography to all specialties of glass painting, or the so-called pyrophotography. We are now able to produce an exact and enduring copy of any picture on a sheet of glass—a transparent photographic glass picture. The process is as follows: A mixture of honey, glycerine, and gum like substances, in certain proportions, is dissolved in water and poured in a thin layer upon the glass on which the picture is to be produced. This layer becomes hard when dried at a temperate heat, but remains nevertheless hygroscopic. When, however, a bi-chromate is added to it, the property of this mixture is modified in such a manner, that exactly in the ratio in which it is exposed to the light, it loses its property of becoming gummy, and instead of this, assumes a horn-like appearance. But all the shaded parts again grow gummy, exactly in the degree to which the shadow prevents the light from acting. It is evident that in order to produce a copy on the glass, it is only necessary to cover with a glass diapositive or an engraving on paper made transparent with oil, the transparent layer modified by a chromate, and to expose the sensitive plate for from five to fifty minutes to the action of the sun. If such a plate has been subjected to the sun, not a trace of a picture can be perceived, but as soon as a black or brown flux, which must be of a flour-like fineness, is dusted over the surface, a true copy of the original will make its appearance, and will stand out with great purity and vigor. It is then only necessary to wash out the finished picture in water, and to expose the plate to a white heat in a glass furnace in order to obtain an image that can only be destroyed with the glass itself."

BRONZE GUNS.—It is well known that bronze, as a material for guns, has the merit of toughness and resists explosive bursting better than iron. But it has been considered objectionable for rifled guns, on account of its softness, and for other reasons. *Engineering* for July 8th says: "Messrs. Montefiori-Levy and Kitzel, nickel manufacturers, of Val-Benoit, near Liège, lately conducted a series of systematic experiments with bronze hardened in various ways. They found that by casting ordinary bronze in chills its hardness and tensile strength were greatly increased. By alloying a small proportion of phosphorus with it they found that an immense augmentation of strength and hardness was the result. After satisfying themselves by various tests that phosphoric bronze cast in chill is, as far as the resistance to static pressure and strain is concerned, vastly superior to ordinary bronze, however cast, they deemed it worth while to institute, under the auspices of the Belgian government, a series of gunnery experiments with the new metal. Phosphoric bronze has long been known. But until the present time no experiments so formal and systematic as those now in progress, have ever been carried out. Two guns have been cast—small smooth-bore muzzle-loaders—one of the ordinary and one of the phosphoric bronze, the latter having been cast in chill. These guns are being tested for hardness, for resistance, for non-liability to corrosion. The experiments are being carried out at Liège by the Belgian officials, in the presence of representatives from nearly all the European nations. Thus far, we are informed, the new metal has established a great superiority."

DELIQATE TEST FOR IRON IN MINERAL WATER.—M. Felix Bellamy macerates 12 parts logwood shavings in 100 parts of alcohol, purified by digestion on quicklime, and distillation from a glass retort. On adding twenty drops of this tincture to two hundred cubic centimetres of water free from iron, the liquid becomes yellow if carbonic acid predominates, or rose-violet if the earthy or alkaline bicarbonates are present. If a clean iron wire be then introduced, the color will lessen to change in the space of one or two minutes, blue striae forming round the metal and passing to the bottom.

NICKEL-PLATED VALVE-SEAT BOLTS.—The *Scientific American* gives cuts of two bolts used side by side for three months, one of which was plated with nickel, and the other not. The first was only slightly discolored; the other so nearly destroyed by corrosion, that less than half the substance of the exposed portion remained.

Scientific Progress.

LIQUID OF HIGH DISPERSIVE POWER FOR PRISMS.—Prof. Gibbs describes in *Silliman's Journal* for July a new method of preparing a liquid for this purpose. We quote: "A solution of phosphorus in bisulphid of carbon has a dispersion nearly one and a half times as great as bisulphid of carbon alone, but becomes turbid on exposure to sunlight from the formation of amorphous phosphorus. It occurred to me that by dissolving sulphur with the phosphorus the formation might be prevented. The solution, as thus obtained, has a pale yellow color, but is perfectly clear and undergoes no change by the action of light. I have been in the habit of preparing it by dissolving one part of dry flowers of sulphur and two parts of phosphorus in four or five parts of bisulphid of carbon, and filtering the liquid through a well dried ribbed paper filter. The refractive and dispersive power of the solution will of course vary with the quantity of phosphorus and sulphur dissolved. By a gentle heat the whole, or nearly the whole, of the bisulphid of carbon may be driven off, a liquid compound of sulphur and phosphorus remaining which has so high a mean refractive power that it cannot be employed with prisms having a refractive angle of more than 45°–50°. The same end may, however, also be attained by continually adding phosphorus to a saturated solution of sulphur in bisulphid of carbon, in which phosphorus appears to be soluble without limit."

IRON PRECIPITATED BY THE GALVANIC CURRENT.—The *American Journal of Science and Arts* for July gives some notes by Lenz in relation to the properties of iron precipitated in the metallic form by the battery: "The iron examined was deposited by Klein's process from a solution of the mixed sulphates of iron and magnesium. Weak currents were employed, and the solution was kept neutral by carbonate of ammonia. Iron so thrown down has a beautiful fine-granular structure, showing no traces of crystals under the microscope. Its color is a soft bright gray. Its hardness is very remarkable—not less than 5.5 of the ordinary mineral scale, and it is excessively brittle, so that it may be rubbed to powder between the fingers. When the iron is slowly reduced upon a polished surface, it is free from flaws and has a velvety look. As it becomes thicker, bubbles or pits are formed as small oval depressions. When heated over a fire the iron loses many of these properties in a remarkable degree. Its hardness diminishes and becomes 4.5; its brittleness entirely disappears, and it becomes so flexible and tenacious that it cannot be broken by repeated bending or even by folding and strongly smoothing down the folds. When heated in vacuo the iron changes color and becomes almost as white as worked platinum. The ignited iron rusts very quickly both in air and in previously boiled water; this is not the case with the metal before ignition. In the electric series unignited iron stands nearer to copper than the ignited metal."

THE GLOBE UNINHABITABLE WITHOUT THE OCEAN CURRENTS.—James Croll, of the Scotch Geological Survey, gives figures to show that the function of the two great oceans is to remove the heat from the equator and carry it to temperate and polar regions. "Aerial currents could not do this. They might remove the heat from the equator, but they could not carry it to the temperate and polar regions; for the greater portion of the heat which aerial currents remove from the equator is dissipated into stellar space. But of what avail would it be, though ocean currents should carry heat to high latitudes, if there were no means of spreading the heat thus conveyed over the land? The function of aerial currents is to do this. Upon this twofold arrangement depends the thermal condition of the globe. Exclude the waters of the Pacific and the Atlantic from temperate and polar regions and place them at the equator, and nothing now existing on the globe could live in high latitudes."

WALLACE ON NATURAL SELECTION.—The author of this new book thinks that Man, at least, could not have reached his development through Natural Selection. We quote a single paragraph: "A brain slightly larger than that of the gorilla would, according to the evidence before us, fully have sufficed for the limited mental

development of the savage; and we must therefore admit that the large brain he actually possesses could never have been solely developed by any of those laws of evolution, whose essence is that they lead to a degree of organization exactly proportionate to the wants of each species, never beyond those wants—that no preparation can be made for the future development of the race—that one part of the body can never increase in size or complexity, except in strict co-ordination to the pressing wants of the whole. The brain of prehistoric and of savage man seems to me to prove the existence of some power, distinct from that which has guided the development of the lower animals through their ever-varying forms of being."

MOTION WITHOUT HEAT BY MOLECULAR CHANGE.—The following is an extract from Liebig on the Origin of Muscular Power, translated for the *Bowdoin Scientific Review*: "Nitric chloride is formed by the action of chlorine upon ammonia; if the ammonia is in excess no nitric chloride is formed, but the ammonia is decomposed with evolution of much heat; if there be no excess of ammonia nitric chloride is formed without any increase of temperature; it is clear that the heat set free, in the first case, is bound up (gebunden) in the other in the nitric chloride, and upon the decomposition of the latter it appears not as heat, but as motion. There are many cases in which mechanical effects or motion are produced by an inner or molecular motion. The magnitude of the effect depends in this case upon the equilibrium or tension of the molecules."

The department of glass tears furnishes a good example of such inner tension; if any part of the surface is marred it flies apart and is reduced to a fine glass powder, in this case without change in the composition of the glass. The separation takes place among the homogeneous particles of the glass, and not among its elementary constituents. In the case of fulminating silver, nitro-glycerine and other substances, a separation of the elements themselves takes place. Nitro-glycerine and fulminating silver may be heated to 100° without decomposition; but the crushing of a minute crystal of the latter with the point of a pen-knife, or a slight blow upon the nitro-glycerine, inducing a change in their molecular constitution, produces a fearful explosion. If nitro-glycerine fall drop by drop upon iron at a glowing heat it is completely consumed, the combustion being attended by a slight hissing sound. In the one case there is developed by the blow an enormous mechanical power, and in the other, by combustion, heat is produced. The mechanical power is the result of an inner or molecular motion; the heat, of the complete combustion of the constituents of the nitro-glycerine. These examples cannot explain muscular power; they only prove that by a change in the molecular constitution of certain compounds, without the agency of oxygen from without, great mechanical effects can be produced."

FRENCH ACADEMY—ELECTRICAL NOTES. *Nature* says: M. Janin recently communicated to the French Academy of Sciences two notes by M. Trévon on electric currents. "In one of these the author cited some further observations in support of his assertions that two currents cannot circulate in opposite directions in the same wire or in the same Geissler's tube; in the second he indicated a method of explaining the course of the currents in telegraphy when terrestrial communications are employed without a return wire. He maintained that the soil is to be regarded as a common reservoir rather than as a conductor.—A note by M. J. Mario on the phenomena of electrostatic induction was read. From his experiments he proposed a theory of terrestrial currents, according to which the air would be a source of positive electricity acting by induction upon the earth."

Two immense shafts arrived at the Bethlehem depot the other day, via the North Pennsylvania Railroad, direct from the machine shop, Philadelphia, intended for the gigantic engine at the zinc mine at Friedensville, said to be the largest machinery erected for pumping water in the world. These shafts each weigh 16,412 pounds, or over 16 tons the two. It was necessary to use a span of 18 mules and a wagon of extraordinary size to convey each singly to the place of destination, which was effected without delay or accident.—*Iron Age*.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Chronicle*, July 23d; A recent survey reveals the fact that the lower tunnel will have to be run one hundred feet further than the distance calculated upon. Work in the shaft has been temporarily suspended.

EXCHECQUER.—Work upon the building has been commenced.

GLOBE.—*Miner*, 23d: The quartz struck last week, proved to be only an outlying ledge, but on passing through it rock of favorable character was entered.

SCHENECTADY.—The stoppings of work in the down shaft created some stir and many surmises. One report has it that they struck into an immense body of soft ore richer than any ever found in the mine.

AMADOR COUNTY.

FINE ROCK.—*Ledger*, 30th Mr. Kennedy hibited some very fine rock from a claim he has lately discovered in Walker's field. The rock shows gold all through it.

SOLD.—The Richmond mine at Enterprise, was sold Thursday to a Philadelphia Co. who will at once commence operations on it.

LANCHA.—Murray & Morrow have at last got into their claim on the bar at Lancha Plana; the dirt on the bed rock pays twenty-five to fifty cents per ton.

ON THE RIVER.—We learn that the miners on French Bar have got into the river and are doing well.

CALAVERAS COUNTY.

FIRST-RATE ROCK.—*Chronicle*, 30th; One hundred and eight tons of quartz, from "Frank Barney" mine at Mosquito Gulch, yielded \$4,900 in the Burr mill at Railroad Flat.

EL DORADO COUNTY.

PAYING.—*Placerville Democrat*, July 30; We are informed that some of the claims on Quartz Hill have been paying remarkably during the week—one claim as high as \$100 to the pan.

SPANISH HILL.—At a miner's meeting held on the 23d, new laws were adopted, making three days work each and every three months, necessary to hold a hill, or drift claim, and three day's work each and every six months to hold a ravine, or surface claim. Also, obliging all claim-holders to record anew within 60 days from date.

FRESNO COUNTY.

BUCHANAN HOLLOW.—The Millerton *Expositor*, July 20th, learns that there is talk of starting up the copper mines again.

MARIPOSA COUNTY.

PROSPECTING.—*Gazette*, July 29th; We learn that the Mariposa Co. has been prospecting an extension of the Princeton mine. They found a vein four feet in thickness, the rock of which prospects \$30 per ton.

NEVADA COUNTY.

EUREKA TOWNSHIP.—*Transcript*, July 27th; The hydraulic miners at Moore's and Woolsey's Flats, and along that great gravel range, have been doing a good business this season. The amounts cleaned up last week aggregated \$30,000. The claims are being consolidated, and they will work in future with larger quantities of water. In the Blue Banks claims, tunnels have been run in different places, and good prospects found in every part of the ground. The owners are arranging to work on an extensive scale. At Snow Point, further down on the same range, Blackwell & Co. have run a bed rock tunnel 400 feet. They will soon raise up to the gravel, and put up hydraulic works.

NORTH BLOOMFIELD.—The company employ 280 men, and gangs on each end of the ditch push the work. The dam across the canyon at Bowman's has been raised to the height of sixty feet.

PROSPECT MINE.—The 50 tons rock from the ledge by this name located near the Grizzly, paid \$500. They now have a 50-foot incline and a 3-foot ledge.

BIRCHVILLE.—The owners have their hoisting works nearly completed, and will commence raising rock in a few days. Their incline is down 150 feet.

METROPOLITAN.—The test by arastras was favorable, and the erection of a mill has been commenced.

BLACK & YOUNG.—The work, both in the mill and mine, is kept up night and day, and thirty-five to forty men are employed. We understand the mine is paying a fair profit.

CONTEMPLATED PURCHASE.—Same of 28th:

We are informed that an English company have under consideration the purchase of the Eureka mine, at Grass Valley. The English Co. have been notified that the mine can be purchased for \$1,080,000.

OMEGA.—Same of 31st: The miners are mostly enganged in cleaning up the bed-rock, preparatory to the final clean up. On Wednesday, a nugget worth \$108 was found in the claims of Burwell & Fuller, and the next day Sam. Hinds picked up a lump worth \$80 in the Prescott claims. The most of the companies will finish cleaning up next week.

RANDOLPH FLAT.—*Gazette*, 27th: William Coombs and J. Grant, are reported to have struck rich gravel in their shaft.

SEVEN-THIRTY MINE.—*Grass Valley Union*, 27th: On Monday there came out in a painful of rock, gold to the value of \$1,500. Two specimens not as large as a man's fist, are valued at \$700. The shaft is down 120 feet. Same of 28th, says: The Seven-Thirty sent in yesterday at 5 o'clock specimens valued at \$2,500 taken out during the day. The mine has yielded since Monday, over \$5,000 worth of gold.

BOWERY MINE.—The rock coming out is fully as good as any which has been crushed. It has averaged \$83 per ton from the surface.

The Grass Valley *Union* of Aug. 2d, says—in reference to the report that an English Co. had been informed that the price of the Eureka mine was \$1,080,000,—that it is a mistake, and that "if any negotiations for the sale of the mine are pending, these are based on \$2,000,000 as the price. The \$1,080,000 figure is a report of a year old. We speak "by the card."

PLACER COUNTY.

PARAGON.—*Herald*, 23d: This claim at Bath, near Forest Hill, owned by Breece and Wheeler, is one of the best in the county. It is worked 3,500 feet into the mountain, at which point it is 450 feet below the surface.

ST PATRICK.—Same of 30th: This mine was conditionally sold some weeks ago for a large sum, but from want of funds or disagreement among the purchasers the bargain was not consummated, and the claim is yet the property of Mr. Eaton. The ledge is sixteen inches thick and has paid from this surface down. There are now thirty tons of quartz at the mouth of the shaft ready for the mill, which will yield \$300 to the ton. Mr. Eaton has taken out \$5,000 in the past few days. For a 40-pound lump of quartz, containing sulphurets and free gold, Mr. E. refused at Grass Valley \$800.

FOREST HILL.—*Stars and Stripes*, 28th: The tunnel of Fett & Co. has been driven 600 feet, and struck the ledge 400 feet below the surface. This vein is five inches in thickness, and yields away up in the hundreds—both in free gold and sulphurets.

TODD'S VALLEY.—Pond & Co. have secured control of all the principal mines and of the ditch that furnishes water. They work two sets of claims; one at the lower end of the valley, where the gravel deposit is eight feet deep, and the other at the head, with a face that will average fifty in depth. During the season, which lasts five to eight months, they use 1,000 inches of water. In the shallow lower diggings they wash off ten to fifteen acres annually, with an average yield of \$10,000 per year. In the deeper upper claims a proportionate amount of ground is removed, yielding annually from sixteen to twenty-four thousand dollars. * * Systematic operations have been commenced in the old Mountain tunnel. Kelly, a member of the original company, has always retained faith in it, and having, during the intervening years, acquired a title to half of it, gave a company of Sacramento capitalists that half for a one-twelfth interest in a new company, formed to push on the work in proper style.

LAST CHANCE.—The Morning Star Cement claim has been paying regularly for seven years. Last year, in spite of some drawbacks, it paid a dividend of \$250 per month to each of the six shares. This year it will be better. For the present month the dividend will exceed \$500 per share. The claim in which Hon. John Yu e made his recent strike adjoins the Morning Star to the eastward.

SAN BERNARDINO COUNTY.

THE MINES. *Guardian*, July 23d: Within 6 miles of the city is a cinnabar vein 300 feet wide, which yields an ounce of quicksilver to the pound of ore. The Holcomb Valley placers are good, and the quartz is worked with profit in arastras. Yellow stone and Clark districts, to the north-east, are promising. In the San Jacinto range, Mr. Stamp is working with arastras a vein that yields \$100 per ton. In

the same range, are the Jesuit and Old Padre veins, which are rich.

The Lytle Creek gold mines, ten miles to the north west, have been worked five years and still yield wages. Near the head waters are three or four mines of argentiferous galena that assay over \$50 per ton. The tin discoveries show specimens richer than the Temescal ore. We predict that this county will soon attract moneyed men.

SIERRA COUNTY.

ITEMS.—*Messenger* July 30th: Watson and Ift at the Oro, are in with the new tunnel 80 feet—about 200 in all. They are beginning to get quartz. Phoenix Mill at Sierra City, is getting along finely. P. Grant, is running the Ned Leonard Mill. Alleghany is getting to be a lively camp. The Oriental at Alleghany, will commence crushing rock next week. The Gold bluff mill recently cleaned up a handsome sum. The McCormick boys are getting good pay in the New York claims, at Alleghany.

SISKIYOU COUNTY.

The Yreka *Union* of the 27th learns that the Black Bear and Klamath quartz claims on Salmon are paying largely. At the Black Bear they have arranged machinery to work the sulphurets.

STANISLAUS COUNTY.

LAGRANGE. *Tuolumne City News*, of the 29th: This camp is not yet played out. A company, representing fifty thousand dollars capital, has been formed, with the view of constructing a huge cement dam across the river at the falls above town. From this will be canals, covering a large area of mining lands.

TRINITY COUNTY.

SILVER. *Journal*, 30th: B. C. Wattles brought this week a specimen of rich silver bearing rock from a ledge on the head of Brook's Gulch near Northfork.

INOIAN CREEK.—The ledge of Silcox & Coon, is promising. But a few inches in width at this commencement, at a depth of thirty feet the vein is six feet across, and the rock rich. Several hundred pounds in a large mortar and washed in a pan, yielded at the rate of \$4 per hundred.

EVERY CITIZEN INTERESTED.—On Wednesday, John Martin and M. F. Griffin, acting for the people generally, made choice of a spot in the Sloan & Fox claims, three quarters of a mile from the Todd place, to sink a shaft to test the question whether a paying deposit exists under the false bed rock in the Weaver Basin. This is something that should have been done long ago.

ITEMS.—The Marysville *Appeal* gets these Trinity items from its traveling agent: On Clear Creek John Harrison is working a claim with two white men and seven Chinamen, and it is yielding from one and a half to two ounces of gold per day to a man. At French Gulch, Walter Whitney is working a hank claim, out of which he is taking, by his own labor, from \$40 to \$50 a day. The Mt. Washington are working ten men in their tunnel, and crushing eight tons a day, which yields \$20 to the ton.

Idaho.

LOOM CREEK.—The *New North West* of July 23d has heard direct from Oro Grande. There are about 400 men in the camp. Mining has gone slow, on account of the water. These are paying from \$30 to \$40 per day to the hand.

SNAKE RIVER.—The *corrine Reporter* has a letter from Eagle Rock, July 10th. Two rockers are at work here. The only one which has a fair start, is making \$10 to \$12 a day to the two men. The writer thinks the bars for miles will pay more or less perpetually; the deposit being renewed yearly by the freshet.

CHIPMUNK MINE.—*Avalanche*, July 30th Four tons of ore turned out \$1,192 in Franks arastra.

Montana.

PILGRIM BAR.—*Dear Lodge Indepi* Holcomb & Beery made a clean up last week of \$4,500 Catching & Co., \$4,800. Several companies have been compelled to suspend for the season on account of the scarcity of water.

PIKE'S PEAK.—McClell & Co. have sold their ground to Blair & Co., for six thousand dollars. On Brattan Bar the German Co. have bought out one of their partner, fourth interest for two thousand five hundred dollars. Catching & Co. cleaned up \$4,900; Beery and Holcomb \$4,500. Walker Fly & Co. have not struck pay yet. Steele & Co., and Hagau & Co. are doing well. All the claims on Gold Hill are winding up for the season.

Nevada.

COPE DISTRICT.

CRESSENT.—*Elko Chronicle*, July 31st:

H. M. Grant, of Mountain City, shipped to San Francisco, July 27, five bars of bullion from the Crescent mine. Value \$6,053.11. Also a gold bar from this surface mines, of the value of \$800.

ASSAY OF BULL-RUN ORE.—T. B. Fitzhugh had an assay of ore from the Potosi ledge, which gave silver per ton \$163.08. This was an average of the rock.

BRUNO DISTRICT.—*Independent*, 27th: There are four companies taking out ore for shipment. The Mountain King has changed hands, and the new Co. has commenced work. The rock looks fine. The Chrysopolis has been taking out ore and is now shipping. The Miner's Rest ore looks well.

HUMBOLDT.

HARMONY DISTRICT.—*Register*, 30th: We learn that the ledge recently discovered is three feet wide and rich in free gold.

GALENA DISTRICT.—The Butte is working sixteen miners, the Shiloh and White mines about the same, and the Avalanche has been leased to a San Francisco Co. The English Co. in Copper Canyon employ fifty men. The Little Giant at Battle Mountain continues to pan out handsomely.

PROSPECTING.—*Silver State*, July 29th: A number of citizens have been prospecting. Several fine looking ledges have been discovered. In the Cayote country very rich float ore was found, assaying \$301 per ton.

Tom Harris' shaft is down 30 feet, and the ore yields by mill process somewhere up in the hundreds.

REESE RIVER.

BULLION.—*Reveille*, 25th: Friday an Saturday shipped through Wells, Fargo & Co. 17 bars of silver bullion, weighing 1,280 pounds; value \$18,754.05. Of this 7 bars, of the value of \$4,658.34, were from Belmont; the balance from the Manhattan mill.

BETTER TIMES COMING.—Same of 30th: The Manhattan mill is running steadily and the rich ore waiting reduction so long will soon be converted into coin.

WASHOE.

YELLOW JACKET.—*Enterprise*, July 31st: The daily yield is 300 tons, one-half from the 900-foot level. Operations on the north works have been suspended and the entire force will be engaged on ore which will yield a large profit.

SAVAGE.—No new developments. It appears to be the intention to place the mine on a paying basis or allow it to remain unworked. The most rigid economy has been adopted.

SIERRA NEVADA.—The ledge of which we gave notice a few weeks since is developing finely. A shaft has been sunk to the track level, all the way in good ore. The mill is stopped a few days for repairs.

CROWN POINT.—About fifty tons of low-grade ore daily from the upper levels. An air drift has been commenced.

CHOLLAR-POTOSI.—The yield for the week foots up 1,580 tons of ore; average assay, \$65 per ton. The greater portion is obtained from the Belvedere and Blue Wing sections. The bullion shipped during the week is \$67,617.60.

HOPE.—The daily yield is 40 tons, which averages \$25 per ton.

GOULD & CURRY.—A small seam of ore was discovered in the Potosi section. It may lead to an important discovery.

HALE & NORCROSS.—Daily yield 295 tons, the greater portion from the 1,200-foot level. The prospects are gratifying.

OPHIR.—The tunnel south from drift No. 2 is still driven at good speed.

OCCIDENTAL.—Preparations are being made for starting up the new mill at an early date.

VIRGINIA CONSOLIDATED.—The drift west at the 500-foot level, is in 505 feet. The ground has become quite soft.

BELCHER.—The ore seam at the 152-foot level is narrower, yet assaying splendidly.

KENTUCK.—Daily yield 25 tons.

CALEONTA.—About the usual amount of ore extracted from the 200-foot level and winze.

SACRAMENTO AND MEREDITH.—The mill is kept running at its full capacity.

WHITE PINE.

ITEMS. *News*:—Two tons of ore from the Robinson mine, near the Trench, sold at \$250 the ton, to be shipped by San Francisco to Swansea, as an experiment. Operations on Autumn No. 2 have been commenced. . . . A series of three mines, one mile north of Mount Ophir, pronounced promising. . . . In three days Jennie A. ledge was stripped 60 feet and 50 tons first class melting ore taken out. One hundred tons more in sight. . . . Chicago capital is interested in Kern District. . . . Strike in South Aurora richest yet. . . . Gov. Matteson will erect three melting furnaces

and separating works in connection therewith. Sub-committees appointed by citizens meeting at Hamilton to put in shape the town plan for separating works. The mill at Hot Creek is running. Splendid specimens brought in from Mohawk Canyon. Mr. Heffron and Dr. McMeans have commenced the erection of a smelting furnace in Robinson District. Report from Robinson on the 26th was that Col. Cummings' reduction works were completed. The average of ore from the mines in the district is \$178 silver. An assay of Dr. McMeans' ore from the Carbonate showed \$2,000 gold, and \$400 silver, to the ton. The Eagle (Walsh) furnace at Swansea is running finely.

Ely District.—Pioche City Cor. of News: Meadow Valley Co.'s work going on steadily, in sinking and drifting. Burke mine producing first-class ore, which is reduced at Ely and Raymond's mill. American Flag looks well. Crook shows at 60 feet a fine body of good ore. Vermilion looks better. Bowery shaft down 70 feet, with good ore nearly all the way. Pioche No. 7 shows good ore through the whole length. The Meadow Valley Co.'s mill is a very complete affair; rock breaker 20-stamp battery, ten new-style pans, five 7 foot settlers, and two Hungerford concentrators. It was put in motion July 15th and worked to perfection. The machinery is from Booth & Co., San Francisco.

Eureka District.—Sentinel, 30th: The Eureka Consolidated broke ground yesterday for a new furnace of 20 tons capacity, which will be completed in 30 days. This will make the capacity of this company alone forty tons per day. J. J. Dunne, has purchased the Macnevin furnace, and has commenced work for the erection of a refinery. Spring Valley, 12 miles west of Eureka, has between 300 and 400 locations in all. The Reeves and Barry has croppings 45 feet thick, and 10 feet high, extending 300 feet east and west. Ore can be traced through the whole extent. Forty tons worked at Austin, gave all the way from \$90 to \$636 per ton. Ten tons North Star were worked from \$60. to \$250. Several other mines show fairly for the amount of work done.

MINERAL HILL.—This camp is 50 miles north of Eureka; and for the present we will place it under that head, instead of under Reese River as heretofore. The Sentinel gives these items.—A new ten stamp mill will soon be running. The ore is very rich.

Two tunnels are being run into the Hill. The one by the Grass Valley Co. has just struck a body of very fine ore.

The tunnel being run by the Pacific Tunnel Co. is in one hundred and twenty-five feet, and strikes are being constantly made of fine ore.

HOOSAC TUNNEL BLASTING.—The nitro-glycerine is delivered in solid form at the magazine, being frozen and packed in ice. The Shanleys never keep more than 500 pounds in their magazine, and seldom more than 300. It is contained in earthen jars on a low bench, a thin layer of water covering the dreaded oil. The magazine is cool and pleasant, but it is not a place where one would choose to sit and smoke during a warm afternoon.

When the requisite number of holes for a blast have been drilled, word is sent to the surface, and the man who handles the glycerine brings it down in little tin cans containing a pound and a half each. Any man may handle gunpowder in a tunnel, but only a few are permitted to touch glycerine, and they do nothing else. The cans are inserted in the drilled holes, with the ends of the exploders inserted in the cork. These ends are connected with wires extending to the battery far away. The workmen have meantime been removing the drill machines and the platform on which they rest, the rubber pipes which convey the compressed air, the tools and every other useful and destructible thing, to a distance of 200 feet or more. The wires are then attached to the two poles of a magneto-electric battery, and a few turns of the little crank are given. A faint thud, a puff of air striking the face, and the work is done. One of the men goes forward and carefully inspects all the holes to make sure that every one has been exploded, and having ascertained the fact, the miners come forward to renew their drilling and to clear away the debris of the blast.—*Boston Advertiser.*

NEW YORK has a big proposition. Some one wants a grand building constructed all around the city for docks and piers. Here all public business is to be transacted, and the top, 100 feet wide, is to form a public promenade and garden. It is only a proposition as yet.

LYNX CREEK MINES. About nine miles eastward from Prescott, Arizona, is Lynx creek. This runs down a ravine, some twelve miles long, in a northeasterly direction, then turns to the East to disappear, after a while, in the sand. At the head of the ravine, in a granite formation, there is a network of veins. The principal ones run S. W. and N. E., dipping about 40 to 45° easterly. They are rich in free gold and sulphurets. While assays run at times very high, \$60 is given as a fair average for free gold, and the sulphurets are said to run very much higher. Among the prominent mines here may be mentioned the Accidental, the Box Elder, Uncle Billy Pointer's, etc. Uncle Billy is working an adit for himself, and taking out \$40 to the ton, without touching the sulphurets. Shelden, with his mule arastra, is getting out \$275 to the ton. The Accidental has been thoroughly explored. Two shafts, about 150 feet apart, have been sunk, one 60 and the other 73 feet. A tunnel, 150 feet long, taps the ledge 150 feet deep. The vein has a thickness of pay ore of 3½ feet. There are, as is generally the case here, good walls on either side. There is an abundance of ore, sufficient to run a 20-stamp mill which is to be erected, and Mr. G. T. S. Curtis has just arrived here to arrange concerning this, and has given us the above items. There is an abundance of wood and water in the place. A road about eighteen miles long, runs down the creek and then to Prescott, which can also be reached by a trail over the hills, which reduces the distance to some nine miles. Mr. Curtis speaks most favorably of various districts, as the silver mines of Turkey creek, etc., etc. Notwithstanding its location, with its rich veins, low prices of labor, etc., Arizona still offers many inducements to the miner. According to this gentleman, the Indians are not so much feared there as outsiders think. If the people were given arms and the authority to use them, there would be but little trouble from the red skins.

THE NEW QUICKSILVER MINES at San Bernardino have been visited by the *Guardian*, who says: The mines are situated near the mouth of City Creek, with a stream of water within fifty feet. On the opposite side is limestone, and on the lower granites. Between these two are masses of conglomerate rock, and in the center is the vein of cinnabar—some three hundred feet wide and dipping some 45 or 50 degrees. We examined the ledge with care, and having seen some of the ore retorted in town, are convinced that the parties have ore almost sufficient to supply the world for centuries. The owners have gone to work in earnest, and are running a tunnel into the mountain. They are only in some ten or twelve feet now, but the rock is easily worked with the pick only, and the workmen are able to make good progress daily. The vein has been traced a considerable distance, and extensions on the lead have been taken up.

NEW MEXICO ITEM.—There have been an extraordinary clean ups. A 24 hours run from Posse, Connollys & Co.'s claim at last Chance, netted 3 pounds of gold, with three men at work. From a 7 days, run on Deau & Sullivan's claim on Grouse, 54 ounces and 14 pwt. was the result. The California company on Humboldt Gulch, are cleaning up 22 ozs. per week. Gold dust is now shipped regularly to the Branch Mint at Denver. Twenty eight pounds was shipped from one house one morning the past week.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, July 21, 1870.
W. T. Atwood states the following as the approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.

Per cent.	Per ton.	Per cent.	Per ton.
12	20 00	18	26 40
13	22 75	19	28 95
14	25 20	20	31 40
15	27 75	21	33 85
16	30 00	22	36 30
17	32 25	23	38 75

Ores assaying above 30 per cent., \$2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

San Francisco Stock Market Review.

THURSDAY EVENING, AUGUST 4, 1870.

The operations in the Stock Board during the past week have been, in the aggregate, quite large, if we take into consideration the present depressed condition of all markets. Chollar-Potosi, Savage, Original Hidden Treasure, and Yellow Jacket attracted most of the attention, large sales having been effected at an advance, with the exception of Yellow Jacket, which shows a slight recession. Of all the Comstock mines, Chollar-Potosi and Halo & Norcross give greatest promise for the future, judging from their present gratifying productive capacity. Otherwise, the reports of the various mines are not so satisfactory.

The Board of Brokers now occupy new and spacious rooms in Duncan's Building, on California street.

CHOLLAR-POTOSI—sold to a larger extent than during the previous week, realizing improved figures. For the week ending July 30th, 1,580 tons of ore were extracted, against 1,186 tons the previous week. All ore-producing localities have been yielding increased quantities. On the 18th floor, in the Belvidere section, the drift running south is again coming into good ore. The Potosi Tunnel, immediately under the 18th floor, is being worked to the width of 28 feet—all in good ore. On the 30th ult., \$34,734 in bullion was remitted to the office in this city.

HALO AND NORCROSS—was in moderate request, ruling at \$94 50 @ 92 50. During the week ending July 30th, 1,809½ tons of ore were extracted, of which 1,442 tons came from the seventh-station level. They have 5,451½ tons in the dumps. The sill-floor on the seventh level is being extended northward, and is now 130 feet north of the shaft. The quality of the ore continues good, but the vein has narrowed down to 23 feet. They are continuing to sink the winze below the seventh level, making slow progress, but are in good ore. The east and west cross-cuts now being run from the south drift, south of the shaft, have not yet reached either the east or west walls. These cross-cuts already show a vein 42 feet wide, but the quality of the ore thus far exposed is very moderate.

KENTUCK—is quiet. During the week closing July 29th, 224½ tons of ore were mined, assaying \$2,394, equal to \$10 67 per ton. CROWN POINT yielded 343 tons during the week ending July 29th, assaying \$4,541, equal to \$13 24 per ton. The incline is down 176 feet, which makes it six feet below the 1,100 level. They are now making better progress in this locality, on account of changes in the material. On the 2d inst., two bars of bullion, valued at \$4,168 79, were sent down from the mine.

OVERMAN—is rather dull of sale. The bullion yield for July amounts to about \$17,000. SEGREGATED BELCHER produced \$26,210 67 in bullion during the month of July, and to date, for August account, \$6,317. GOULD AND CURRY declined from opening rates. They extracted 313½ tons of ore during the week ending August 1st, the average assay showing \$39 60 to the ton. On the 2d inst., the development in the southeast drift, middle adit, looked quite favorable for a sufficient production to pay the expense of the entire drift. SIERRA NEVADA produced 792 tons from the ledge, and 50 tons from the gravel deposits, for the sixteen days ending July 31st.

EUREKA (Cal.) disbursed a dividend of \$750 per share, payable on and after the 5th inst.

COMING.—According to common report we are to have soon another distinguished guest in the person of Wm. H. Seward.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:
PANAMA M. Co.—Ely District, Nevada, August 3 Capital stock, \$24,000, in 20,000 shares. Trustees: M. Gardner, S. A. Raymond, S. Heydenfeldt, J. A. Pritchard, and G. Walton.
The following have been recorded in the Secretary of State's office, Sacramento:
BROOKS HILL M. Co. Nevada county, July 26. Capital stock, \$50,000, in 500 shares. Trustees: E. C. Webster, A. Lorchonso, and J. Burnett.
LA GRANGE FLOUR MILL AND DITCH Co.—Stanislaus county, July 28. Capital stock, \$40,000, in 400 shares. Trustees: W. E. Thursby, B. H. Delaney, R. Gannon, George K. Davis, and John Reed.

Meetings, Elections, Etc.

IDA ELMORE MINING COMPANY.—August 1st. Trustees: M. J. McDonald, John M. Wilson, A. P. Miner, O. H. Bogart and Louis Vesaria.
COLUMBIAN M. Co. Aug. 1. Trustees: Edmund Mark, (President), Jas. Milburn, E. F. Bucklin, D. R. Brown, and S. A. Sanderson. A. Nodal Secretary.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the SCIENTIFIC PRESS and other San Francisco journals.]

THE BORAX COMPANY.—The Lower Lake Bulletin learns that the California Borax Company are about resuming operations after an inactivity of two years or more. The Borax Lake is quite low owing to the evaporation induced by the extreme heat this summer.

TO MINERS, MILLMEN AND METALLURGISTS.
Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

The Possibilities of Wheat Culture.

On examining the organization of a head of wheat, it will be found that each grain occupies a cell, and that generally, even in what is called a full head thereof, for every three cells "filled out" or containing grains, there will be two empty or imperfectly developed cells. These empty cells also, for the most part, will be found interspersed among the grains or cells which are filled, and not at the top or bottom of the head. The number of cells in a head is generally from 75 to 105; but, even under the best of cultivation, it is seldom that we find the number of grains to exceed 60; from 45 to 63 is the general average of good culture. But as Nature has evidently provided for at least one-third more in number, we should never think of ceasing in our efforts to improve, until the ultimate possibilities of the endeavor have been reached.

It is moreover claimed that if we could succeed in growing a perfect head—that is, in filling every cell with a grain of wheat, nature would then develop still other cells. A close examination of any healthy seed will exhibit certain rudimentary formations which goes to support such a supposition. If these sayings are facts, and we believe they are, and incontrovertibly established, it will be perceived that we are generally raising but about half as much wheat as we should raise from any given area; and moreover, it will be long before an absolutely full ear of wheat will be produced. The possibility of what we have alluded to may well be accepted when it is borne in mind that the hundred or more varieties of wheat now known, have all been produced from a wild growth which originally, produced a seed no larger than the smallest mustard seed.

Farmers, and especially wheat growers, would do well to study and think more of these things. Such study will be found a powerful incitement to improved cultivation, and earnest, intelligent efforts to reach the possibilities of wheat culture. Carefully examine your growing crops, bearing in mind the numerous hints which we have thrown out from time to time on this subject, and you cannot fail to be convinced that, as a general thing, the most careful cultivators have heretofore realized but half crops, and but few even that much. Experiment on small portions of your fields—say a few square feet, if no more—keep a record of your results, and you will be astonished at what you will learn.

Utilizing Marsh Grass—Management of Cows.

Mr. Phelps, of San Mateo, is making use of what is generally supposed to be a wholly useless product, the coarse grass growing in the muddy salt marsh, bordering his ranch, immense quantities of which may be seen growing all along the bay of San Francisco. This grass is cut by Mr. Cole with a grain cradle, each clip being thrown into a boat, pushed along over the mud by the side of the party cradling, then loaded into a scow at the most convenient point and taken to the landing. At the barn it is washed by discharging fresh water from a hose pipe on to it for the purpose of removing the salt. It is then fed to the milch cows with a small quantity of oil cake meal sprinkled over it. The fact that it is green has the effect to very much improve the color and flavor of butter at this season, when everything else is dry.

The above fact has been furnished us by a correspondent, for which we are much obliged. Cows in milk require much care and attention. When they are kept up frequent feeding is better than unfrequent. A given amount of food, fed five or six times a day, will keep up the flow of milk, when with the same amount, fed only three

times, they will fall off. Water, too, should be given often—more often than a cow will willingly seek for it if she has to travel any great distance. In frequent feeding care should be taken that no more is given at a time than will be eaten up clean, say in one hour and a half from the time it is placed before them.

In California the grass becomes dry comparatively early in the summer, and the milk, in consequence, scarce and thin, and the butter light colored. When grass fails and resort is had to hay, as among the dairies near this city; or when grass is plentiful, but dry, cows should have at least one feed per day, (two would be better) from roots or some green fodder, such as cornstalks, etc., in order to keep up the quality of the milk, and color, as well as quality of the butter. Many resort to extraneous means for coloring the butter, employing therefor annatto, a solution of scraped carrots or something of the kind. Such things may not be injurious to the butter, but they are, at best, but a poor substitute for the natural color, which should be secured by placing before the animal proper food. A little green food will add materially to the quantity, as well as quality, of both milk and butter, often two pounds per day or more to the former.

While corn, cut when half-grown, beets or some other roots are decidedly preferable, the substitute which Mr. Cole is employing, as above described, will no doubt answer a very good purpose, and especially as it can be obtained at ranches situated on the Bay in liberal quantities and at a very low cost.

The oil meal employed by Mr. Cole is a very valuable addition to his feed, and it is most surprising that so little is used in this State where it is so cheap. In England oil meal is largely employed at a cost of \$60 per ton, while we believe it is but \$30 or thereabouts, here. The English feed it to all kinds of stock, and regard it as almost indispensable. If we would have milch cows yield milk largely, we must give them variety in their food to stimulate their appetites. They will be all the better therefor, both in flesh and yield.

Crops in Alameda County.

Grain crops throughout portions of Alameda County that border along the bay, are a fair average with past seasons. Wherever the land was well tilled, and free from foul growth, if the seed were sown early, so as to be well started before the spring rains, heavy crops are the result.

The only failure of an average or more than an average crop, is in consequence of careless culture, and mismanagement, on the part of the farmer.

A busy scene of harvesting greets the eye of one traveling over the fertile district that reaches from Oakland to the borders of Santa Clara Co. The black smoke of the threshing engines, and the lighter, surging dust from the separators, often attract the attention; while stacks of packed grain, and loaded teams on their way to the ware-houses, are the cheering signs of plenty. Enquiring of a farmer, Mr. Clawita at Mount Eden township, who has finished his harvesting, how his crops turned out this season, we were informed that from 60 acres of barley he got 1500 sacks, averaging, 125 lbs to the sack, and from 75 acres of volunteer wheat and wild oats, he cut 200 tons of excellent hay.

Mr. Leonard Stone, near San Lorenzo, from 21 acres of Australian wheat, sown about the middle of December, on ground that had been cropped constantly to grain for ten years, got 55 bushels to the acre.

Mr. T. A. Brown, near Brooklyn, from a large field of oats on land that had been long and constantly cropped, averaged 46 bushels to the acre.

We are aware that in the eastern part of Alameda county, in Livermore Valley, and vicinity, that some crops were a total failure, but everywhere around the bay,

within direct influence of the moist sea, breezes one of the never failing garden spots of the Pacific, has vindicated itself beyond every doubt. The abundant yield of fruits, and of vegetables also add their curious richness to the products of a bountiful season.

Our Industrial Condition—The Homestead Mania.

Among the various evils which have resulted in a stagnation and lack of confidence in industrial enterprises on this coast, one may be mentioned as very prominent—the investment in homesteads and lands for speculative purposes, of such sums of money as were needed in active pursuits. "Put your money into land and let it lie" was the cry and rage one and two years ago. To such an extent was this kind of idle speculation carried, that most other enterprises were but secondary considerations with the masses. Farmers and others who owned land in the vicinity of our large towns, suddenly found themselves rich from the sale of such lands at greatly advanced prices, and this without any exertion of their own. And still fortunes were realized again and again, from selling the same lands at ever increasing rates. Farms were divided into tracts of a few acres, and again sub-divided into smaller lots; streets were laid out and "seven-by-nine" "homesteads" sold to anybody who had money, or the prospect of ever getting any. A little cash down, and monthly payments on the balance; or any way to get money from the people, were the plans adopted. Many and ingenious were the societies, incorporations and organizations formed for the purpose of inducing people to invest in such speculations. The display that was made by those who became rich from selling lands, only incited the masses to further investments. Magnificent residences and all the luxuries of extravagant wealth and pride became the order of the day, and a rivalry of competition in splendor, even brought ruin upon the fortunate ones in many instances. Whoever owned lands in the neighborhood of San Francisco was considered rich, while every one who could buy "ever so small a lot" was sure to make money or a fortune by investing. The word "crazy" has too rational a meaning to convey a proper idea of the reckless infatuation and avidity with which everybody "bit at the bait."

Lands that had been cultivated became "too valuable" to be devoted to producing crops; manufacturing interests were slow coaches; there was a faster way of making money than in making machines or running them. The Overland Railroad would be the making of the country; an immense population and travel would fill our State—buy up our land and build up our cities; imagination was unlimited; conjectures unbounded, and the wildest speculations were to realize fortunes without end! No need of home manufactures. We could make money by importing goods. Our mining excitements and other "prospects" all had weight. Our valuable time could better be employed in buying and selling lands and goods, than in producing the necessities of life. Government lands were bought up by the wholesale, while the cities and suburbs were retailed at immense profits. The rates of interest were kept up, out of the reach of industrial interests and every productive business lagged. And it still lags—and still we, a bankrupt and moneyless people, import what we might with economy produce at home. Our manufacturing interests are neglected. Moneyed men exhibit no desire to invest in industrial enterprises. They would sooner get interest, or wait for better times! And the man that has enterprise without ample means is actually discouraged from such pursuits.

But in the very nature of things, something must change, and radically change too. With the brightest skies we have the cloudiest prospects—with the richest soils we have the poorest farmers and the smallest profits. With a vast field of resources, almost undeveloped, and with every natural advantage for prospering, we are idly drifting down the current we ought to ascend. The Overland Railroad is not the sole cause of our trouble, as some of its enemies assert, although it is an expensive toy, bought with imported labor. The railroad would be quite as glad to bring

emigration, as the land owners would be to see it brought. But as long as manufacturing industry is discouraged, and it is necessary to enrich speculators to obtain farms in a favorable locality, just so long emigration will not be in a hurry to come to California. Neither is the high price of labor so much our misfortune as many suppose. When everybody gets enough work and good pay, times are good and money is plenty—a thousand little enterprises are encouraged that amount to great good, both in detail and in the aggregate.

Legitimate business enterprise is our great need, and the time has come when idle speculation will not pay; when some sort of economy is becoming necessary. Let money seek the ordinary channels of industry; let time and labor become of some remunerative value in supplying the necessities of life and of prosperity; let the actual and the real take the place of the flimsy foundation of fictitious values and imaginary schemes, and prosperity will again visit us.

S. H. HERRING.

PROFITS OF MARKET GARDENING.—Mr. E. Jones, an old American resident of San Leandro, who is raising vegetables for the curing and pickling establishment of Cutting & Co., of this city, has 90 acres under cultivation this season. From eleven acres of Marrowfat peas he sold 1,100 sacks at \$2,200 this season. He has four acres of Squash peppers, comprising 40,000 plants, which will average one pound to the plant, or 40,000 pounds. At two cents per pound—a low wholesale price—he will realize \$800. Mr. Jones has contracted 9,000 boxes of tomatoes to the same firm, at 62½ cents. At this very low price he will realize about \$175 to the acre. The bean crops this year, in Alameda county, have so far, from some cause, proved a failure; but the appearance of the vines now indicate a good late crop. Mr. Jones also cultivates a large lot of cucumbers, etc., etc., for pickling. He calculates on about \$100 profit per acre, on the most of his produce this season.

Nearly all of the vegetable business in Alameda county is carried on by the Portuguese—a very industrious and economical class of citizens. Very few of them can read and they are a very clanish sort of people, but they seem to take a pride in American institutions and educating their children. They have no desire to return to the old country, but may be depended upon as becoming part of our people. As a race they are not a bad element to be incorporated into our civilization.

S. H. HERRING.

GRASS SEED IN SOIL.—A somewhat interesting illustration of the length of time some seeds will remain dormant in the soil, without losing their vitality, was recently observed by Hon. T. G. Phelps, on his ranch near Belmont, San Mateo county. He has a piece of land bordering on some salt marsh, which was thoroughly ploughed three times, with intervals of several weeks between plowings, then sown with beets, and cultivated so often that no grass or weeds were allowed to appear. These beets were pulled as they were needed for feeding purposes. On quite a large portion of this tract the beets were not gathered until too late to put in any other crop, and as the ground had been perfectly bare of everything except beets for over fifteen months, and left as useless for the remainder of the season, it was a little singular to observe that burr clover started up in such profusion that 2½ tons per acre has just been harvested.

DAIRY PROFITS.—Mr. D. E. Knight, of Brooklyn, Alameda county, has sold, since the first of January, 450 pounds of butter, the produce of three cows that have fed upon pasture alone, at an average of 40 cents per pound, \$180 net. He has during the same time supplied his own family of five with milk and butter from the same cows, and raised twelve fine calves, worth \$125, from the skim milk. Mr. K. has also a fine lot of ducks and other poultry, which pay in like proportion.

What I Know of Farming—No. 29.

Esculent Roots—Potatoes.

In no other form can so large an amount and value of human food be obtained from an acre of ground as in that of edible roots or tubers; and of these the potato is by far the most acceptable and in most general use. Our ancestors, it is settled, were destitute and ignorant of the potato, prior to the discovery of America, though Europe would now find it difficult to subsist her teeming millions without it. In traveling pretty widely over that continent, I cannot remember that I found any considerable district in which the potato was not cultivated, though Ireland, Western England, and Northern Switzerland, with a small portion of Northern Italy, are impressed on my mind as most addicted to the growth of this esculent. Other roots are eaten occasionally by way of variety, or as giving a relish to ordinary food; but the Potato alone forms part of the every-day diet alike of prince and peasant. It is an almost indispensable ingredient of the feasts of Dives, while it is the cheapest and commonest resort for satiating or moderating the hunger of Lazarus. I recollect hearing my parents, fifty years ago, relate how in their childhood and youth, the poor of New England, when the grain crop of that region was out short, as it often was, were obliged to subsist through the following winter mainly on potatoes and milk; and I then accord to those unfortunatees of the preceding generation a sympathy which I should now considerably abate, provided the potatoes were of good quality. Roasted potatoes seasoned with salt and butter and washed down with hounteous draughts of frosh buttermilk, used in those days to be the regular supper served up in farmers' homes after a churning of cream into butter, and I have since eaten costly suppers that were not half so good.

The potato, say some accredited accounts, was first brought to Europe, from Virginia by Sir Walter Raleigh in 1586 or 1587, but I do not believe the story. Authentic traditions affirm that the potato was utterly unknown in New England, or at all events east of the Connecticut, when the Scotch-Irish who first settled Londonderry, N. H., came over from old Londonderry, Ireland, bringing the potato with them. They spent the winter of 1719 in different parts of Massachusetts and Maine, quite a number of them at Haverhill, Mass., where they gave away a few potatoes for seed, on leaving for their own chosen location in the spring, and they afterwards learned that the English colonists, who received them, tried hard to find or make the seed-balls edible the next fall, but were obliged to give it up as a bad job, leaving the tubers untouched and unsuspected in the ground.

I doubt that the potato was found growing by Europeans in any part of this country, unless it be in that we have acquired from Mexico. It is essentially a child of the mountains, and I doubt if it grew wild anywhere else than on the sides of the great chain which traversed Spanish America, at a height of from 5,000 to 8,000 feet above the surface of the ocean. Here it found a climate cooled by the elevation and moisture by melting snows from above, and by frequent showers, yet one which seldom allowed the ground to be frozen to any considerable depth, while the pure and bracing atmosphere was congenial to its nature and requirements. In this country, the potato is hardiest and thriftiest among the White Mountains of New Hampshire, the Green Mountains of Vermont, on the Catskills and kindred elevations in our own State, and in similar regions of Pennsylvania and the States further south and west.

My own place is at least 15 miles from, and five hundred feet above Long Island sound; yet I cannot make the potato, by the most generous treatment, so prolific as it was in New Hampshire in my boyhood, where I dug a bushel from 14 hills, grown on rough, hard ground, but which, having just been cleared of a thick growth of bushes and briars, was probably better adapted to this crop than though it had been covered an inch deep with barn-yard manure.

He who has a tolerably dry, warm, or sandy soil, covered two or three inches deep with decayed or decaying leaves and brush, may count with confidence on raising from it a good crop of potatoes, provided the seed be sound and healthy. On the other hand, all authorities agree that animal manures, unless very thoroughly rotted and intimately mixed with the soil, are injurious to the quality of potatoes grown thereon, etimulating any tendency to disease, if they do not originally produce such disease. I believe that swamp muck,

dog in summer or autumn, deposited on a dry bank or glade, and cured of its acidity by an admixture of wood ashes, or lime, or of salt (better still, of lime and salt chemically compounded by dissolving the salt in the least possible quantity of water, and elaking the lime with that water), forms an excellent fertilizer for potatoes if administered with a liberal hand. A bushel of either of these alkalies to a cord of muck is too little; the dose should be double if possible; but, if the quantity be small, mix it the more carefully, and give it all the time you can wherein to operate upon the muck before applying the mixture to your fields.

Where the muck is not easily to be had, yet the soil is thin and poor, I would place considerable reliance on deep plowing and subsoiling in the fall, and cross-plowing just before planting in the spring. Give a good dressing of plaster, not less than 200 pounds to the acre, directly after the fall plowing; if you have ashes, scatter them liberally in the drill or hill as you plant; and, if you have them not, supply their place with superphosphate or bone dust. I think many farmers will be agreeably surprised by the additional yield which will accrue from this treatment of their soil.

Those who have no swamp muck, and feel that they can afford the outlay, may, by plowing or sub-soiling early in the fall, seeding heavily with rye, and turning this under when the time comes for planting in the spring, improve both crop and soil materially. But even to these I would say, apply the gypsum in the fall, and the ashes or lime and salt mixture in the spring; and then, with good seed and good luck, you will be reasonably sure of a bounteous harvest. If a farmer, having a poor, worn out field of sandy loam, wants to do his very best by it, let him plow, sub-soil, sow rye and plaster in the fall, as above indicated, turn this under, and sow buckwheat late the next spring; plow this under in turn when it has attained its growth, and sow to clover; turn this down the following spring, and plant to let potatoes, and he will not merely obtain a large crop, but have his land in admirable condition for whatever may follow. I am quite well aware that such an outlay of labor and seed, with an entire loss of crop for one season, will seem to many too costly. I do not advise it except under peculiar circumstances; and yet I am confident that there are many fields that would be nearly doubled in value by such treatment, which would richly repay all its cost. That most farmers could not afford thus to treat their entire farms at once, is very true; yet it does not follow that they might not deal with field after field thus thoroughly, living on the products of forty or fifty acres, while they devoted five or six annually to the work of thorough renovation.

A quarter of a century ago we were threatened with the complete extinction of the potato as an article of food; the stalks, when approaching or just attaining maturity, were suddenly smitten with fatal disease—usually after a warm rain, followed by scalding sunshine—the growing tubers were speedily affected; they rotted in the ground, and they rotted nearly as badly if dug; and whole townships could hardly show a husel of sound potatoes.

A desolating famine in Ireland, which swept away or drove into exile nearly two millions of her people, was the most striking and memorable result of this widespread disaster. For several succeeding seasons, the potato was similarly, though not so extensively, affected; and the fears widely expressed that the day of its usefulness was over, seemed to have ample justification. Speaking generally, the potato has never since been so hardy or prolific as it was half a century ago; it has gradually recovered, however, from its low estate, and though, the malady still lingers, and from time to time renews its ravages in different localities, the farmer now plants judiciously and on fit ground, with a reasonable hope that his labor will be duly rewarded.

It seems to be generally agreed that clayey soils are not adapted to its growth; that if the quantity of the crop be not stunted, its quality is pretty sure to be inferior; and I can personally testify that the planting of potatoes on wet soil—that is, on swampy or spongy land which has not been thoroughly drained and sweetened—is a hopeless, thriftless labor—that the crop will seldom be worth the seed.

As to the ten or a dozen different insects to which the potato-rot has been attributed, I regard them all as consequences, not causes; attracted to prey on the plant by its sickly, weakly condition, and not really responsible for that condition. If any care for my reasons, let him refer to what I

have said of the wheat plant and its insect enemies.

There has been much discussion as to the kind of seed to be planted, and I think the result has been a pretty general conviction that it is better to cut the tubers into pieces having two or three eyes each, than to plant it whole, since the whole potato sends up a superfluity of stalks, with a like effect on the crop to that of putting six or eight kernels of corn in each hill.

Small potatoes are immature, unripe, and of course should never be planted, since their progeny will be feeble and sickly. Select for seed none but thoroughly ripe potatoes, and the larger the better.

My own judgment favors planting in drills rather than hills, with ample space for working between them; not less than thirty inches: the seed being dropped about six inches apart in the drill. The soil must be deep and mellow, for the potato suffers from drought much sooner than Indian corn or almost any other crop usually grown. I believe in covering the seed from 2 to 2½ inches, and I hold to flat or level culture for this as for everything else. Planting on a ridge made by turning two furrows together may be advisable where the land is wet; but then wet land never can be made fit for cultivation, except by underdraining. And I insist upon setting the rows or drills well apart, because I hold that the soil should often be loosened and stirred to a good depth with the subsoil plow; and that this process should be persevered in till the plant is in blossom. Hardly any plant will pay better for persistent cultivation than the potato.

As to varieties, I will only say that planting the tubers for seed is an unnatural process, which tends and must tend to degeneracy. The new varieties now most prized will certainly run out in the course of twenty or thirty years at furthest, and must be replaced from time to time by still newer, grown from the seed. This creation of new species is, and must be, a slow, expensive process, since not one in a hundred of these varieties possesses any value. I don't quite believe in selling—I mean in buying—potatoes at \$1 per pound; but he who originates a really valuable new potato deserves recompense for his industry, patience, and good fortune, and I shall be glad to learn that he receives it. *Horace Greeley.*

THE STANDISH STEAM PLOW.—The Massachusetts *Plowman* furnishes the following item with regard to what is being done with the Standish steam plough in Boston:

The new steam plough manufactured by Coffin & Standish, South Boston, was exhibited near their establishment between 4th and 5th streets, on Thursday afternoon of last week. The new plough is nineteen feet in length, and will plow from six to nine feet in width. It rests upon four wheels, and the ploughing is done by five sets of revolving knives, each about twenty inches long and two inches wide, and book-shaped at the end. A swath ten feet wide is ploughed at a time, and from three to twenty inches deep. In this case the power of the engine was thirty-horse. The plough cost \$10,000, and it is estimated will break up about thirty acres of land a day, with two men to manage it. It has a number of improvements on the original machine built at Martinez, in California, and is made stronger in some of its parts. It is the intention of the proprietors to work the machine briefly at Chicago, and then carry it to California as originally proposed.

TALL POTATOES.—There seems to be something peculiar about the "Big Tree" regions of this State, which has a tendency for the production of tall vegetation. The *Fresno Examiner* says that Mr. Wm. Hill planted a quarter of an acre upon his ranch, near the Fresno big trees, with potatoes, the tops of which grew to seven feet in height, while he took out a ton and a half of potatoes from the patch, equal to twelve tons of potatoes to the acre! The ground is shaded by trees and is very rich.

A NEW ROAD SCRAPER OR SCOOP.—A Californian now at the Western States has become much impressed with the value of a new scraper or scoop, which he thinks will revolutionize that class of work. He does not describe the machine; but says it will soon be offered for sale in this State.

THE LOWER CALIFORNIA EXPEDITION left the city, last Saturday, on the schooner *Fanny A. Hyde*.

Ramie, Nuts and Small Fruit.

A San Lorenzo, on the farm of Mr. Wm. Meek, there is growing a fine lot of 1600 ramie plants. Rooted cuttings were set in March, in fine light alluvial soil, and now stand from one to three feet high, with from 8 to 20 shoots or branches, which look vigorous and thrifty. The plants were a little backward in growing at first, but are now pushing ahead rapidly and give promise of success.

Land that will produce good corn, is said to be suited to the ramie. Irrigation is quite beneficial and will well reward the trouble in extra growth. It is the intention of the proprietor to propagate what he can by layers, with a design to extend the plantation as fast as possible.

Nut Trees.

Mr. Meek planted a pecan tree, nine years ago, which is now six inches in diameter, and twenty feet high, it is a beautiful, thrifty tree, but has not borne yet. An American Black Walnut of the same age is of the same size; and has produced a few nuts. He has two Burr Oaks the same age, from acorns gathered in Iowa. They stand fifteen feet high, are about three inches in diameter, and are bearing this season. Several California Black Walnuts planted at the same time, are over thirty-six feet high, and four feet in circumference—fine trees, bearing fruit. Several English walnuts are also doing finely.

Indeed it is evident that nut trees of all kinds, when planted in suitable soil and localities in this State, will be a sure success and profit.

Profits of Cherry Culture.

From six acres of about 600 trees, Mr. Meek has received for cherries, clear of expenses and commissions, over \$6,000 this season.

Currants.

About two acres of cherry currants, have given a clear profit in the sales of cuttings and fruit, of \$1,800, this season.

California Silk Business at the East.

A convention of silk manufacturers in the United States was held in New York recently to take some measures for the promotion of the silk-producing interest on the Pacific coast. We shall look with interest for a report of the doings of this convention. It is intimated that they contemplate the organization of a company, which will send an agent here, to examine our mulberry plantations and coconeries, with power to invert or loan money to enable our growers to extend their operations. Silk operators at the East, as well as in this State, are thoroughly confident, not only of the unsurpassable quantity and quality of our future cocoon crops; but also of the general profits which must be realized from them, wherever they are conducted with care and prudence. The experiments of the last five years have relieved all doubt as to the fitness of our climate, and the generally profitable nature of the business of raising cocoons and producing eggs or raw silk. The home production of raw silk is an important desideratum for the whole country; and Eastern manufacturers are exhibiting a most commendable and patriotic spirit in their efforts to foster the business in the only State in the Union where there is any probability of its becoming practicable and profitable.

STREET PAVING.—Some little alteration has been made in the usual practice of paving streets in London. The portion of Fleet street which has just been repaved, has been done in the following manner: The paving-stones were laid with strips of wood or hoop iron between each row of stones, to keep the rows apart. As soon as a sufficient number of rows were laid, the wood or iron strips were removed, and the spaces partly filled up with clean gravel. After this the remaining space was filled with melted asphalt. —*Scientific Journal.*

Sixteen Pages Extra.

We have postponed our double sheet issue in order to print a THIRTY-TWO PAGE EDITION, shortly, containing the paper, already announced, entitled: "A Guide to California Immigrants." Its publication has been delayed partly on account of the printers' strike.

ACADEMY OF SCIENCE.—At the meeting on Monday a number of members were elected. Some fossils were presented by Mr. Hanks. Dr. Stout made some remarks on the excellence of carbolic acid for preserving specimens of Natural History. The largest animals can be thus preserved. Prof. Davidson spoke of the seals on the coast, giving some valuable and interesting facts. Dr. Cooper made some observations on a trip made to Castle Peak on the Sierras. The structure is basalt and conglomerate; neither climate, flora nor fauna are strictly alpine. Action is to be taken with regard to inviting the American Association to hold their next annual meeting in this city.

A SOCIAL MEETING of the Editorial party occurs at the Mechanics' Institute, on Friday evening, after we have gone to press. We should, however, be within the bounds of truth, were we to state that it was, (or will be, if any one prefers) a most enjoyable meeting. We have found our old friends of the party, still so dear to us, and our new ones so pleasant, that any meeting with them is a pleasure, and every thought of their approaching departure a regret. May they carry away with them as sunny memories of their visit, as we have experienced.

INTERESTING LECTURE.—We are happy to announce that the public will have an opportunity this (Saturday) evening to hear a lecture delivered by one of the excursionists now in this city. The Hon. J. V. C. Smith, formerly Mayor of Boston, will speak concerning Egypt—Its Ancient Splendor—Its Ruins—Its Modern Condition, Government and Institutions. The lecture will be delivered before the Mechanics' Institute and will commence at 7.45, P. M.

Separating Silver and Lead.

Now that the subject of separating works is being agitated at White Pine, a few words on this topic may not be out of place. The *News* has had much to say in regard to the matter, but as we have missed several numbers, we are unaware exactly how much. What we have seen was good. An establishment of the kind, well managed, and in which the miners themselves had a large interest, so that it would be conducted for the benefit of the mines, would be a most excellent thing for the place. One such would be amply sufficient, as this could always be enlarged to meet all requirements, and the expense of one large establishment would be much less than that of several smaller ones, and improvements would be introduced much sooner.

The old way of separating lead and silver was by cupelling the whole mass. As much lead, however, did not contain enough of the more precious metal to pay for the expense of this process, not only was much silver lost to the world, but many lead mines were valueless which otherwise would have made good returns. But when, in 1829, Pattinson invented his process for previously concentrating a large part of the silver in a small portion of the lead, mining received a new impulse. The process is founded on the fact that, on melting argentiferous lead in large quantities and letting it cool gradually and equally, a part will separate in the form of crystals, while the silver remains mostly in the liquid. A complete separation is practically impossible for several reasons. How far the desilverization can be carried out, depends on economical grounds. The enriching can be performed until the lead contains about 2 1/4 per cent. of silver, after which both crystals and liquid contain about the same amount of this metal. As to the high and low systems and their modifications, we doubt not that the *News* has enlightened its readers. The high system is generally applied to richer and less pure lead, and requires a larger number of pans (up to fifteen); the low system is used for poorer and purer qualities, but requires only two or three pans. Modifications are made according to circumstances. Experience has shown that the larger the amount treated, within reasonable limits, the better the process goes on. Hence it is desirable always to have as much as possible on hand, which is an argument for one large establishment rather than several small ones.

The pans generally used are of cast iron and have, with a capacity of 240 to 250 cwt., an inside diameter of about 7 feet, and a depth of 3 feet. It is a mistake to make them too thick, as their durability is not increased thereby and they apparently have no good influence on the crystallization. A thickness of 1 1/4 inches at the bottom and 1 inch at the top is ample. As the weight of the lead causes the heated vessel to belly out below, a masonry pillar underneath, to support the bottom of the pan, is often advisable. A good vessel is worn out by the alternate expansion and contraction of the iron, which causes the foundation of minute cracks through which the lead leaks. The length of time a pan lasts, is of course very indefinite and depends to a great extent on the management of the fire. A well made kettle may be used, generally speaking, for 250 to 300 crystallizations before the lead begins to go through, and for, say, 100 subsequent processes before it becomes useless. A large pan, according to the above figures, weighs, in round numbers, from 16 to 20 cwt., and would cost here \$100 to \$125. The foundries would be willing to furnish them at the very lowest prices possible (we have seen the proprietors in regard to this matter) provided they can only get a fair amount of custom. In Germany, pans of sheet iron (1/2 in.) have been tried, with success, we believe. These can be furnished there at a cheap price and

are preferable on many accounts (freight, for instance); but as the parts must be welded, and not riveted, they are not to be thought of here. In England we find many establishments using cast iron pans, 5 to 5 1/2 ft. wide and 2 1/2 to 2 3/4 feet deep and holding 6 to 10 tons. Our experience and what we have learned from those who have worked for years at the process, leads us to favor large amounts, other things being equal. The loss of lead varies greatly, say, from 1 1/2 to 5 per cent. according to its purity, and the management of the kettles.

For this process a large number of workmen are required. This renders desirable the use of machinery as far as possible. In Germany, small ladles are used and only manual labor is employed. In England, often larger ladles are taken and raised and lowered by means of a crane and pulleys. A gentleman at the Freiberg smelting works suggested, a number of years ago, an ingenious contrivance. He proposes a railway above the pans, on which runs a wagon frame. To this is attached a large ladle which just fits the inside of the pans. While the lead is cooling this revolves in the kettle so as to stir up the fluid metal and keep it throughout of the same temperature. When enough crystals have formed, by shifting the belting, the ladle with the crystals is raised by means of a screw on its suspending rod, then the wagon rolls over the proper pan and the ladle is lowered in a similar manner; and so the process is carried on. Having personally thoroughly exhausted ourselves in working hand-ladles in this process, we are practically aware of the exertion necessary, and are inclined to the use of machinery where the monetary conditions allow it.

When at Stolberg, near Aix-la-Chapelle, in 1868, we saw a process with three pans and stirring machinery, apparently the same as that described in the *News* of July 15th. The proprietors assured us that this was a great economical success, but refused to give any figures, or to let us remain longer than merely to see one operation.

Of late years the desilverization of lead by means of zinc has been pushing the Pattinson process in Europe. It is founded on the greater affinity of silver for zinc than for lead. The old Parke process was given up some time ago, on account of the trouble in separating the zinc and lead, and the consequent loss of the latter metal. The process has lately been revived in the Harz, and improved, and the Condurif process (of Toulouse, France) is highly spoken of. We can, however, but just mention it here. It is, in brief, as follows. About 22,000 lbs. of lead are melted in a kettle; from 1 to 2 per cent. of zinc is introduced and the whole stirred; the zinc scum which forms on top and holds most of the silver is removed and liquated: the desilverized lead is treated with steam in a closed kettle heated to a cherry-red heat, whereby the zinc is oxidized; the rich zinc scum concentrated (by liquation) is treated in different ways; by the Condurif method it is treated with steam; rich oxides and rich lead result; the latter is cupelled; the former are heated with hydrochloric acid; the chloride of zinc is lost; the residue is melted and gives rich lead for cupellation. This is merely the barest outline of the process. We may perhaps speak further of it at some future time. Meanwhile those interested can find a full description in the *Zeitschrift für das Berg-, Hütten- u. Salinenwesen* for last year, or an able translation of the same by Mr. F. Prime jr, in that valuable publication, the *Technologist*, commencing with the June number.

The above hints, derived from actual practice, may be of value at the present time. They are not intended as a description of the process, but merely as "extracts from the note-book".

On and after to-day, the banks in this city will close on Saturdays at 12 M.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JULY 26TH.

FAUCET.—James H. Lord, San Francisco, Cal.

SPADE AND SHOVEL.—John W. Pearce, Suisun, Cal.

TUCK-CREASING ATTACHMENT FOR SEWING-MACHINES.—James Billings Safford, San Francisco, Cal.

CANDLESTICK.—Henry Zahn, San Francisco Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

CABLE-STOPPER.—J. Stitt, San Francisco.—A strong metal bar or rod is bent to a U-shape, or at right angles, so as to have the two arms parallel. On these arms are two cross-heads, arranged so as to slide up and down, and with blocks of India rubber or other elastic material between. Nuts at the ends of the arms prevent the lower cross-head from slipping off. A rod passes through the middle of the cross-heads and the blocks, and is secured by nuts at the end above the upper cross-bar. Hence, on drawing this rod outward, the blocks of elastic material are compressed, the upper cross-head sliding on the parallel arms. The upper end of this U-shaped bar is firmly secured to the proper chain or cable. The lower end of the rod above mentioned is also secured to a chain which terminates in a clutch or "devil's claw." This is a short iron bar, 1/4 which is slotted at one end, in which is pivoted, near its middle, one end of a rectangular piece of metal, 1/2 the projecting arm of which is slotted. The pivoted arm of this bar fits into the slot in the bar, 1/4 both slot and arm being beveled at the bearing point, and a ring is arranged to slide along the bar, 1/4 so as to bind the arm firmly in the slot. This ring is made polygonal, so as to be turned by a wrench, in order to bring a small slot in its inner side in position to unlock over a corresponding projection on the bar, 1/4.

DEVICE FOR CURLING HAIR.—S. L. Tibbals, Dutch Flat, Placer Co., Cal.—This is a device to be used for curling hair, rendering the process easy and convenient, and doing away with the usual curl-papers or leads, as well as the often injurious heated iron. It consists of a tapering piece of plate or sheet metal bent longitudinally into an S-shape; also of a pin made of a piece of wire bent upon itself so as to have a slight spring. One of the ends of this wire is bent or hooked so that it can be made to clasp the other. To curl the hair, (gentlemen will please read no further) it is wet or dampened in a solution prepared by the inventor, wrapped spirally on the tapering, S-curved iron and fastened, so that it will not untwist, by two pins, one on each side; one arm of the pins being inserted under the hair, through the groove in the iron, and then locking on the other which passes over the hair. The iron can then be withdrawn, leaving the pins to hold the curl in the proper position until it is desired to remove them.

ALARM TICKET NIPPERS FOR COUPON TICKETS.—I. Hyde, Oakland. We are generally supposed to hold a man innocent of any crime until he is found guilty. In practice, however, certain classes of men seem to be excepted from this rule; and among these are the conductors of street cars. It is a settled conviction on the part of the public that a conductor is dishonest with regard to making proper returns of fares received, and takes every possible occasion to secretly increase his income. We do not express any opinion as to the justice of this conviction, we merely give it as what appears to be a fact. To prevent any such dishonesty our conductors in this

city have certain ticket nippers, which cut off and hold the coupons, which can be removed out of the nippers only at the companies' offices by the proper persons. As, however, the dishonest man attempts this prevention measure to a great extent by sometimes pretending to cut off a coupon without actually so doing, the above device has been invented as more effectual. To describe it fully would take more space than we can give. Suffice it to say that it is a cutting apparatus so arranged and connected with an alarm, that on cutting a ticket, and only in such a case, the alarm is sounded, giving notification of the fact. If anything should be substituted for the regular ticket, the fraud would be discovered upon opening the box of the nippers at the office.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That there shall be attached to the Department of the Interior, the office, heretofore established, known as the Patent Office, wherein all records, books, models, drawings, specifications, and other papers and things, pertaining to patents, shall be safely kept and preserved.

SEC. 2. And be it further enacted, That the officers and employees of said office shall continue to be: one Commissioner of Patents, one Assistant Commissioner, and three examiners-in-chief, to be appointed by the President, by and with the advice and consent of the Senate; one chief clerk, one examiner in charge of interferences, twenty-two principal examiners, twenty-two first assistant examiners, twenty-two second assistant examiners, one librarian, one machinist, five clerks of class four, six clerks of class three, fifty clerks of class two, forty-five clerks of class one, and one messenger and purchasing clerk, all of whom shall be appointed by the Secretary of the Interior, upon nomination of the Commissioner of Patents.

SEC. 3. And be it further enacted, That the Secretary of the Interior may also appoint, upon like nomination, such additional clerks of classes two and one, and of lower grades, copyists of drawings, female copyists, skilled laborers, laborers and watchmen, as may be from time to time appropriated for by Congress.

SEC. 4. And be it further enacted, That the annual salaries of the officers and employees of the Patent Office shall be as follows: Of the Commissioner of Patents, \$4,500; of the Assistant Commissioner, \$3,000; of the examiners-in-chief, \$3,100 each; of the chief clerk, \$2,500; of the examiner in charge of interferences, \$2,500; of the principal examiners, \$2,500 each; of the first assistant examiners, \$1,500 each; of the second assistant examiners, \$1,500 each; of the librarian, \$1,500; of the machinist, \$1,000; of the clerks of class four, \$1,800 each; of the clerks of class three, \$1,600 each; of the clerks of class two, \$1,400 each; of the clerks of class one, \$1,200 each; of the messenger and purchasing clerk, \$1,000; of laborers and watchmen, \$720 each; of the additional clerks, copyists of drawings, female copyists, and skilled laborers, such rates as may be fixed by the acts making appropriations for them.

SEC. 5. And be it further enacted, That all officers and employees of the Patent Office shall, before entering upon their duties, make oath or affirmation truly and faithfully to execute the trusts committed to them.

SEC. 6. And be it further enacted, That the Commissioner and chief clerk, before entering upon their duties, shall severally give bonds, with sureties, to the Treasurer of the United States, the former in the sum of ten thousand dollars, and the latter in the sum of five thousand dollars, conditioned for the faithful discharge of their duties and that they will render, to the proper officers of the treasury, a true account of all money received by virtue of their office.

SEC. 7. And be it further enacted, That it shall be the duty of the Commissioner, under the direction of the Secretary of the Interior, to superintend and perform all the duties respecting the granting and issuing of patents which herein are, or may hereafter be, by law directed to be done; and he shall have charge of all books, records, papers, models, machines, and other things belonging to said office.

SEC. 8. And be it further enacted, That the Commissioner may send and receive by mail, free of postage, letters, printed matter, and packages relating to the business of his office, including Patent Office Reports.

SEC. 9. And be it further enacted, That the Commissioner shall lay before Congress, in the month of January, annually a report, giving a detailed statement of all money received for patents, for copies of records or drawings, or from any other source whatever; a detailed statement of all expenditures for contingent and miscellaneous expenses; a list of all patents which were granted during the preceding year, designating under proper heads the subjects of such patents; an alphabetical list of the patentees, with their places of residence; a list of all patents which have been extended during the year; and such other information of the condition of the Patent Office as may be useful to Congress or the public.

SEC. 10. And be it further enacted, That the examiners-in-chief shall be persons of competent legal knowledge and scientific ability, whose duty it shall be, on the written petition of the applicant, to revise and determine upon the validity of the adverse decisions of examiners upon applications for patents, and releases of patents, and in interference cases; and when required by the Commissioner, they shall hear and report upon claims for extensions, and perform such other like duties as he may assign them.

SEC. 11. And be it further enacted, That in case of the death, resignation, absence or sickness of the Commissioner, his duties shall devolve upon the Assistant Commissioner until a successor shall be appointed, or such absence or sickness shall cease.

[TO BE CONTINUED.]

A Automatic Cylinder Cup.

Concerning the device, which we illustrate to-day, we hear none but favorable opinions expressed. Indeed, it is one of those things, which plainly bear the marks of being good contrivances. It is simple, durable and effective, as can be seen by a glance.

NATHAN & DREYFUS' PATENT AUTOMATIC CYLINDER LUBRICATING CUP.

Instead of admitting the tallow or other lubricant into the cylinder in considerable quantities, now and then, to be blown out immediately, this cup delivers it in regular drops into the body of the steam, which thereby becomes thoroughly greased

by its admission being regulated by the valve, D. Coming in contact with the top of the cup, it condenses, falls to the bottom and floats up the lubricant, until this reaches the hole, G, when it runs down the tube, falling into the steam, which disseminates it equally everywhere.

In this way nothing but clean oil or tallow is admitted into the cylinder, and the lu-

bricating is performed regularly the whole time that the engine is in motion. There is consequently a very great saving in tallow, and also a considerable increase in the power of the engine, and an economy in fuel. Proper lubrication of the work-

SECTIONAL VIEW OF THE CUP.

before passing into the steam chest; and thus it is disseminated in fine particles over all of the internal parts of the engine, which are thereby thoroughly and regularly lubricated.

The construction of the cup is simple and can be readily understood from the cuts. The cock, E, is for emptying and cleaning the vessel. The steam from the cylinder rises up through the centre tube,

screwing the tube, F, down further, so as to increase the condensing space in the cup. The engineer should ascertain, as nearly as possible, how much lubricating material is required for the valves and piston of his engine, and he can then regulate the flow to provide this amount. This contrivance, called the Nathan and Dreyfus Patent Automatic Cylinder cup, has proved in practice, as far as we can hear, to be reliable and also economical, which we can readily believe. The agent for it on this coast is Mr. Wilkie Darling, 629 Washington street, San Francisco.

Mineral Oil in Australia.

About eighty miles from Sydney, in New South Wales, near the western slope of the Blue mountains, large deposits of shale rich in oil, have been found, on the line of the Great Western Railway. The shale, as we learn from *Engineering*, occurs between layers of sandstone, in a seam from five and a half to six feet thick, and dipping about one in thirty-six to the northeast. About one hundred tons of shale are raised every week, transported by a tramway to the railroad, and thence to Sydney to supply the refining works at Waterloo.

Here the shale is retorted in a set of sixty retorts, five cwt. of rock being put into each retort. The vapor is condensed and collected in a large tank, then pumped into crude oil stills, five in number, and again collected in a tank. Then it is treated in acid agitators and allowed to settle, and then charged into soda agitators and subjected to a similar process. The agitators are for bringing any particle of oil into contact with the acid. When the oil has thus been made sufficiently pure it undergoes a final distillation.

The refinery has a capacity of 20,000 gallons per week, which can be finished by one man and a boy. The refined oil has an excellent reputation. Its specific gravity of 0.800 at 60° Fah., and the flaming point is 120° Fah. The demand for it is so great that the refinery will be enlarged at no distant day.

WORDS OF ENCOURAGEMENT.—A former reader of the *SCIENTIFIC PRESS*, in this State, but who is now traveling in the Western States, writes us among other things: "I miss the substantial and well-selected reading of the *SCIENTIFIC PRESS*." He institutes a flattering comparison between it and similar papers in the older states and adds: "It might not be doing any wrong to say, in this connection, that California has far more energy among her masses than the region of country in which I am traveling, with all its railroads and other advantages." The same correspondent, in speaking of the crops of Illinois and Ohio, pronounces the wheat crop medium; corn, excellent; oats and grain, good.

A scientific gentleman who has long been a regular subscriber, in writing from Woodstock, Md., and forwarding his subscription, says: "I am much pleased with your paper, and take great pleasure in reading it. * * * Receive my best wishes for your welfare, and for a large circulation for your valuable *SCIENTIFIC PRESS*."

EUREKA is getting along rapidly. It now has a paper, the *Sentinel*, published by Skillman & Co., which presents a remarkably neat appearance, and contains much matter of interest. We are glad to see these papers springing up in the new districts, especially when they promise so well.

TURTLE-RAISING is to be tried by an enterprising citizen of San Francisco. At least, he thinks of it.

SENTENCED.—Gen. O'Neil has been sentenced to two years imprisonment in the State Prison and a fine of ten dollars.

SANTA CLARA COLLEGE.—On the 9th inst. the Inauguration of the New Hall and Annual Commencement of this Institution, and on the 10th, the Celebration of the Philalethic Society, will be held. A special train will be run from San Francisco, going down at 4:30, P. M., and returning at the close of the exercises.

Metallurgy and Ores.

MINING SCHOOL.

Mosheimer's Practical Mining School
Will be opened by the FIRST OF JUNE, and practical
instruction given in all branches of Assaying,
Crushing, Amalgamating, Concentrating, Smelting and
Refining Ores; also Erecting Furnaces and Reduction
Works of every kind. To give all miners a chance to
learn Assaying of Ores (what everyone ought to) I have
reduced my former charge for

Assaying Ores.....\$ 60.00
To work Gold and Silver Ores.....100.00
Smelting and Refining, including Assaying.....150.00

Many gentlemen who have been taught in my estab-
lishment will bear testimony that in a few days they
learned more than they expected to learn in a month.
Before going into mining, every man ought to know
how to test ores, and then he will go to work with pru-
dence and never fail to be successful. Apply to

J. MOSHEIMER,
Office, 323 Montgomery street; Works, 2,003 Powell
street, San Francisco. 22v23-3m

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY. FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successfully

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

And by authorized Local Agents. 3v21-3m

ENGRAVING ON WOOD

DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper

Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & CO.,
No. 414 Clay street, S. F.

THE AMERICAN SUBMERGED PUMP.

Has a leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal.

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

PRICE LIST.

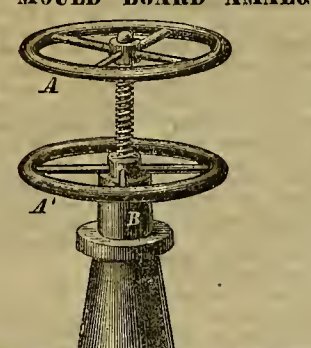

No. 0.—Iron, \$15 ; Iron Galvanized, \$17 ; Capacity, 500.....	Gallons per Hour.
" 1.—" 25 ; " 30 ; " 1,000 to 1,200.....	" "
" 2.—" 40 ; " 45 ; " 2,000 to 2,500.....	" "
" 3.—" 70 ; " 75 ; " 4,000.....	" "

Larger sizes made to order of any required capacity. Hand power.

MANUFACTURED AND FOR SALE BY

PACIFIC PUMP MANUFACTURING COMPANY,
City Agents, - - - WILSON & DIXON,
Plumbers and Gas Fitters, 318 Pine Street, San Francisco.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the millers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (co-operative), 19 First street, S. F.,
Where it can be examined and further particulars be learned ; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums :

First—For the design and plan selected and adopted.....	\$2,500
Second—For the second best design and plan.....	2,000
Third—For the third best design and plan.....	1,500
Fourth—For the fourth best design and plan.....	1,000
Fifth—For the fifth best design and plan.....	500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

26v20-4m

TREATMENT OF REBELLIOUS SILVER ORES,
by Charles H. Aaron—a pamphlet of eight pages of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid

Reading for the Hour.

A Sudden Strike.

Our printers surprised us on Monday by saying that we should increase their wages, from 60 to 75 cts. per 1000 for piece composition, or from \$24 to \$30 per week, or they would quit work in seven hours. It was a short notice, but more than long enough for us to decide that just after reducing the subscription price of our journal 20 per cent, and adding a large amount of reading matter to its columns, we could not, and would not, accede to such untimely and unfair demands.

Accordingly the Eureka Typographical Union "retreated in good order."

We have been paying type-setters, higher wages in coin than any other city has in currency, and now during extreme business depression their demand has been for the highest rates paid since 1857.

Our printers have enjoyed the reputation of an intelligent and honorable craft, and this strike is no doubt without a precedent and without a parallel. It was not advised or endorsed by some of the best members of the Union, who, however were bound by oath to the action of the majority. The interference practiced with apprentice boys in this instance, is a new feature in printers' strikes, although strictly in keeping with the spirit that has denied the boys (and girls) a fair chance to learn a trade and earn an honorable livelihood. We now have satisfactory help and are not personally hurt by the sudden demands of the printers, but to dailies, and those job printers who were bound to large contracts based on the going rates of composition it works great injustice. Unbiased and liberal thinking men, who fully understand this strike, will condemn it as long as it is remembered.

METALLIC MANGANESE.—M. A. Valenciennes, according to an English paper, of the St. Denis Chemical Works, near Paris, has lately prepared metallic manganese and several of its alloys. The former, obtained by the reduction of pure binoxide of manganese in a magnesia crucible, formed a brittle and very hard button. Immediately after breaking it, the pieces were as white as cast iron, but more rapidly oxidized by the air. Manganese shows great affinity for copper. Valenciennes prepared several alloys of copper and manganese, containing from 3 to 20 per cent. of manganese, all of which resemble very much the copper-tin alloys (bronzes), being like these hard sonorous and easily fusible.

THE THAMES EMBANKMENT.—The grand embankment along the Thames at London was formally opened on the 13th. There was a procession, headed by the Metropolitan Board of Works, with the Prince of Wales, court dignitaries, municipal bodies and others. The buildings along the route of the procession (from Westminster bridge to Charing Cross bridge) were handsomely decorated. There were speeches and a dinner. The embankment is said to have cost, so far, \$8,250,000. A large amount of ground is reclaimed, of which five and a half acres are to be opened to the public as ornamental gardens.

THE OPENING of Bancroft's new store on Market street, last Saturday, was a very pleasant affair. Judging from the number of those who attended in the evening, the Messrs. Bancroft must have a large number of friends. Visitors were shown over the whole of the handsome and well arranged establishment, and ample provisions were made to refresh those exhausted by their exertions in going through the large building. Our agricultural visitors were beamingly present. It truly is a magnificent and creditable establishment for this coast.

Puget Sound.

It is very probable that this section will become very important in view of its being the terminus of the Northern Pacific Railroad. The natural advantages of the place are such that, in connection with the completion of the railroad, we sometimes wonder that we do not hear of a greater eagerness to secure land there. Certainly some one is bound to secure a fortune in this region.

We have been getting some statistics in regard to this region lately, and a correspondent of the *Bulletin* last week gave some interesting items on this subject. The Sound affords many good harbors. The amount of lumber here is immense, statistics in regard to which we lately quoted from the *Overland*, and, according to the *Bulletin's* correspondent, there are eleven steam saw-mills now in constant operation. There is a fair supply of farming, grazing and fruit-growing land. Woolen mills and sawing and planing factories already exist. Coal and iron are said to abound. The Seattle coal mines extend a mile and a half over the company's land, and consist of four distinct veins, varying from four to nine feet in thickness. How far the coal extends on the lands of other parties is not known. A tunnel has been run in 300 feet and a tramway extends three miles westward to Lake Washington, for transportation purposes. This is not yet ready for use, but will be by next August, when the company say they can deliver up to 200 tons daily. Seattle has already 2,000 inhabitants and business is getting very lively.

With all these advantages on the land and the water, not excepting the fisheries which promise well, it will be surprising if this region does not rapidly grow up into an important section of the coast.

CASTING PISTON PACKING.—*Engineering* illustrates a new plan for molding, instead of turning, the helical rings of metal used for packing pistons. We quote:—"Usually these rings are manufactured by first casting a cylinder of metal, and then turning it in a lathe to the helical form required, whereas Messrs. Pollitt and Wiggell's plans consist in casting the springs ready for use, thereby retaining the crust of the cast metal so as to make the ring more durable and elastic, and not so liable to corrosion by the condensed steam and water. The plan employed is as follows: A cylinder or an outer shell and a core are prepared by ordinary loam moulding apparatus, and when dry the core is fixed upon a face plate, or upon a mandril, to which rotary motion is given, and by means of a tool having a slide motion there is cut out of the loam a spiral groove of the size and form necessary."

PHYSICIANS FEES IN PARIS are regulated by law, and are fixed on the most economical basis. For a first visit within the city limits a physician is allowed to charge 50 cents to \$1; for each subsequent visit 25 to 50 cents. If at a distance of from one to five miles from town and suburbs, his first visit may be from 75 cents to \$1.50, and subsequent ones from 50 to 75 cents. For a first visit at night, he gets, if it be in town, from \$1.50 to \$2.25; if more than a mile out of town, from \$2.25 to \$3; following night visits, being in town, from 75 cents to \$1.50; in the country, \$1.12 to \$2.25. He may not charge for more than two visits a day, unless they be by special request, nor must his fees for all attendance on any one patient within twenty-four hours exceed \$2.25.—*Ex.*

FASTENING STEEL RAILWAY TIRES.—The following method is described by a correspondent of the *Railway Times*:—"The tire is put on cold, and well seasoned wood blocks are then driven with great force into their seats; the tire is then turned, and the ends of the blocks are neatly faced off even with the rim of the wheel. The Master Mechanic assures me that, during an extended trial of this method, he has never seen the need of any other fastening to the tire."

We have received, from the Hon. Mr. Julian, a pamphlet containing his very able report with regard to the Hutchings and Lamou grant.

Prussians vs. Frenchmen.

There were ten great battles in 1812, namely: Lutzen, May 2d; Bantzen; May 20th and 21st; Lucknau, June 3d; Gross-Beeren, August 26th and 27th; Kulm, August 30th; Dennewitz, September 6th; Leipzig, October 16th, 18th and 19th; Hanau, October 29th and 30th; besides the engagement of Wartenberg, October 3d, the combat of Moekern, near Magdeburg, April 5th, and innumerable smaller fights, impossible to remember. The only battles in which Prussians alone, without Russians or Austrians, fought the French were Lucknau, Gross-Beeren, Katzbach and Dennewitz, and the engagement of Wartenberg, in all five of which the Prussians were victorious. The battle of Dennewitz is, moreover, the most glorious victory of this century. Forty thousand Prussians under Bulow utterly routed 70,000 Frenchmen under Ney.

In the year 1814 there were six important battles: La Rother, February 1st; Bar-sur-Aube, February 27th; Leon, March 9th and 10th; Montreuil, March 15th, I believe; Arcis-sur-Aube, March 20th, and Paris, March 30th; then the engagement of Craonne, March 8th, if I remember right; the combats of Chempaubert, Vauchamps, Etoges and Montmirail, besides minor fights. Of these the Prussians alone engaged the French at Laon, Etoges and Montmirail, in the first victoriously, in the two latter they were beaten. In 1815 there were two battles, Ligny and Waterloo, and two engagements, at Quatrebras and Wavre, besides the smaller fights. Of these the Prussians fought alone at Ligny and Wavre. In the former they were beaten; the latter was undecided.—*Cincinnati Commercial.*

Greeley vs. Handwriting.

We find the following correspondence which would denote that H. Greeley does not write as plainly as he might.

[From H. Greeley to M. B. Castle.]

DEAR SIR: I am overworked and growing old. I shall be 60 next Feb. 3. On the whole, it seems I must decline to lecture henceforth, except in this immediate vicinity, if I do at all. I cannot promise to visit Illinois on that errand—certainly not now. Yours, HORACE GREELEY.

M. B. CASTLE, Sandwich, Illinois.

[From M. B. Castle to H. Greeley.]

Sandwich, Ill., May 12.—HORACE GREELEY, New York *Tribune*.—Dear Sir: Your acceptance to lecture before our Association next winter came to hand this morning. Your penmanship not being the plainest, it took some time to translate it; but we succeeded, and would say your time—"3d of Feb."—and terms—"50¢"—are entirely satisfactory. As you suggest, we may be able to get you other engagements in this immediate vicinity; if so we will advise you. Yours respectfully,

M. B. CASTLE.

THE DEAR BABES.—We are not responsible for the following statement:

The method of baby farming in England is this: The parents who desire to farm out their children and thus get rid of the care of them, pay the matron of a private infant hospital \$20, or about that, to take charge of their babe. It is undoubtedly understood that the inhuman parents do not care ever to see their offspring again, and the mercenary nurse puts it out of the way by ill treatment or downright violence as soon as possible.

NEW WORK BY KNETEL.—"Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver." Under this title Dewey & Co., of the Scientific Press, San Francisco, will soon publish an excellent work by Guido Knetel. The reputation of the author renders unnecessary any further recommendation of the work, which, it is said, will be a clear and complete treatise on these subjects, which are of so much interest at the present time. Miners and others will find it of great value. The various methods and furnaces employed in roasting, and chlorination and lixiviation with the different manipulations and apparatus, will be fully described, and amply illustrated, together with remarks on the various advantages and disadvantages of each process, and their special application on this coast.

We would be glad to see fifty copies of this work in the hands of those having charge of and interested in mining operations in Alpine. Knetel is on the right track, as time will show.—*Alpine Miner, Silver Mountain, Cal.*

The above work contains 120 pages, and the price is \$2.50 coin or \$3 currency. For sale at this office.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PETRIFIED TREES.—C. H. Denison writes to the *Bulletin* that at Calistoga Springs he found twelve petrified trees. The largest is twenty feet long and six feet in diameter, the roots being below the surface of the soil. This tree was broken squarely across in seven places. Besides these, two other gentlemen in one day found forty others within a mile.

It is a great thing for elderly persons to have their fading eyesight restored to its youthful perfection. This can be done by Muller, who is recognized as the offician of the Pacific coast. His Brazilian spectacles, properly fitted and adjusted, are superseding all others in use.

PATENTS ON THE PACIFIC COAST.—To those of our friends who desire to keep posted upon inventions upon the Pacific coast, we say, subscribe for the *SCIENTIFIC PRESS*, published by Dewey & Co., San Francisco, Cal., at \$4 per year. The opening of the railway across the continent has given to all patents a much higher value in that portion of our country known as the Pacific slope, and all interested will find the paper above alluded to a valuable reference.—*Mechanic and Inventor, Detroit, Michigan.*

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries at Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the *SCIENTIFIC PRESS* and Patent Agents, have just issued a most little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the *SCIENTIFIC PRESS* office, postpaid, for \$1.—*New Age.*

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye, Inflammation of the Eye, Opacities of the cornea, cures permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 128 Kearny street. 25-520.

JAS. A. SULLIVAN, of Calaveras county, is requested to call at this office, or address us, on business.

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENYON, GARR & CO. 2721-3m

TO FARMERS.—Stevens & Bro's Egg Boxes, holding 30 dozen, supplied free of charge, by John Gray & Co., No. 210 Clay street, San Francisco, to all customers. The eggs are kept cool and free from moisture and mould, are in no danger of being broken, and require no recommending. 20V20-3m

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10V18-6m R. F. HOWLAND.

BOILER FELTS.—Saves twenty-five per cent. of fuel. BERRY & PLACER'S MACHINERY DEPOT, No. 114 California street. 1V21-3m

BLOE TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24V19-3m

NEVERMORE.—Can the coarse, gritty tooth powders and the tooth-destroying chemical fluids find a place on the toilets of sensible people? The fragrant and preservative Sozonox has superseded them all.

FALDING'S GLUE mends Furniture, Toys, Crockery, all ornamental work.

Free Information for Inventors and Patentees.

Our Patent Office Circular, relating to U. S. and Foreign Patents, Caveats, Patent Laws, Rights of Inventors, Valuable Hints, Illustrated Mechanical Movements, etc., comprises 48 pamphlet pages, embracing the following

List of Contents:
Advancing Cases; Advantages, Important; Assignments, Forms, Cost, etc.; Caveats of what they consist, Form of Cost, how Filed effectively; Cost of Obtaining Patents; Confidential Advice; Copies of Patents Assignments, etc.; Copyrights; Dangers of Delay; Designs, Patents for; Engravings and Illustrations; Engine, Condensing-Beam—Illustrated; Extension of Patents; Foreign Patents—all Countries; Foreign Inventors; Hints to Inventors; Government Fees; List of; Home Counsel; How to Obtain Patents—Steps Necessary; Hydrostatic Press—Illustrated; Interferences; Influence at Washington; Laws (U. S.) and Decisions Relating to Patents; Lathe, Engine—Illustrated; Letters Patent—of what they consist; Library, Reports, Law Books; Locomotive Engine—Illustrated; Medicines or Compounds, Patent for; Mechanical Movements—Illustrated; Mining and Scientific Processes; Patents for; Record of Pacific Coast Patents; Re-issues; Rejections—Cause and Remedy; Reports of Patent Office; Rights and Privileges of Inventors and Patentees; Saving of Time; Self-evident Facts; Selling Patent Rights; Springs, Various Kinds—Illustrated; Stamp Battery, Quartz—Illustrated; Telegraph, Patent Business by; Unsuccessful Applicants; Who can Obtain Letters Patents; What Claims can be Patented; Worthless Patents, Candid Reasoning.
This pamphlet will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed by

DEWEY & CO.

U. S. and Foreign Patent Agents, Scientific Press Office, 414 Clay street, San Francisco.

Pushing Forward.

It is hardly necessary in commencing a new volume, as we do to-day, to remind our readers that we are constantly *pushing forward* in our efforts to improve the **SCIENTIFIC PRESS**. We have never relied upon promises of what we propose to do; but have always been able to point to what we have done in the past, as the best assurance of what is in store for the future.

At the opening of the present year we reduced the price of the paper from \$3 to \$4 per annum, believing that the modified condition of affairs on the Pacific slope, growing out of the opening of the Overland Railroad, and other facilities for more frequent intercourse with other portions of the world, fully warranted such a step. Our anticipations have been more than realized in the increase of subscriptions, so much so as to enable us to give an additional amount of reading matter by the presentation to our readers of a double-sheet the first issue of every month.

Illustrations.

We have also made such arrangements as are now enabling us to greatly increase the number, interest and variety of our illustrations. While this improved feature adds largely to the cost of publication, we feel confident the additional interest and value thereby given to our columns, will be duly appreciated by a discerning public.

The Miner, the Mechanic, the Inventor, the Farmer and the Naturalist, will all find something of constant and practical interest in this direction.

The Miner will always be presented with everything new in the way of reducing ores, whether by mill process or by smelting.

All important improvements in Machinery will be promptly presented to the Mechanic, while the Inventor will be as regularly furnished with hints and stepping stones upon which others have mounted, and from which he in turn will be able to see still further and more clearly into the un-discovered future.

The ideas and instructions that we are here constantly placing before the Farmer will speak for themselves. If the reader will pardon us for a mere hint at the future, we venture the promise that no one thing that is new and of any real importance in the mechanics of Agriculture shall be omitted in that portion of our illustrative department.

The Naturalist too will now and then find something to interest and instruct; while the general reader is never forgotten.

How far we have succeeded in making the **SCIENTIFIC PRESS** acceptable to the public, we can only judge by the words of hearty commendation which we are constantly receiving, not only from our brethren of the press, but from numerous private letters, from the readiness with which our patrons pay up their annual subscription and from the rapid increase in the list of subscribers.

A reference to the index published in our last issue affords the best evidence of the wide field of research and instruction in which we are engaged. The present number affords ample evidence of the truth of what we have written, and to strangers our subscribers can fully attest that the present is but an average of our issues on the first of each month.

The carefully digested mining summary which we give each week; the chronicles of scientific and mechanical progress; the large and varied information on agricultural matters, and the many matters of general and special interest, together with the numerous illustrations, in all the various departments, combines an amount of information which for value, interest and variety, will not suffer in comparison with any periodical of the day.

We trust that those for whom the **Press** is published will exert themselves to enlarge its sphere of usefulness by extending its circulation, and thus strengthening the hands of the publishers for still greater efforts, feeling satisfied that the benefit will be mutual.

July 2d, 1870.

Land Purchasers' Association.

NOTICE.—At a meeting of the Board of Trustees of the Land Purchasers' Association, held August 4, 1870, the following resolution was adopted by unanimous vote:

Resolved, That an assessment of ten dollars per share, gold coin, be, and the same is hereby levied, upon each and every share of the capital stock of the Land Purchasers' Association now held by subscribers therefor, for the monthly installment falling due and payable August 1st, 1870. Said assessment is payable on or before the thirtieth day of August, A. D. 1870, to James F. Crosett, Secretary, at the office of the Association, No. 304 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, A. D. 1870, shall be deemed delinquent, and will be advertised for sale at public auction, and unless payment shall be made before will be sold on the 24th day of September, A. D. 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. F. CROSETT, Secretary.
Office, 304 Montgomery street, San Francisco. Jy 4

Eagle Quicksilver Mining Co.—Location of Works: Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of July, 1870, an assessment of twenty dollars (\$20) per share was levied upon the mines of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his Office, Room No. 26, Haywood's Building, No. 419 California street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Monday, the 19th day of September, 1870, shall be deemed delinquent, and will be duly advertised on September 24th, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.
Office, Room No. 26, Haywood's Building, 419 California St., San Francisco, California. Jy 30

Jennie A. Consolidated Mining Company, White Pine District, Nevada.

Notice.—There is delinquent upon the following described Stock, on account of assessment levied on the twentieth day of June, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the second day of June, 1870, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Company, 514 Merchant street, Room 26, San Francisco, Cal., on Saturday, the sixth day of August, 1870, at the hour of one o'clock p. m. of said day, to pay said delinquent

assessment thereon, together with costs of advertising and expenses of sale.

A. MARTINON, Secretary.
Office, 514 Merchant street, Room 26, San Francisco, California. Jy 16

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of July, 1870, an assessment of two dollars and a half (\$2.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 230 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.
Office, 220 Clay street, San Francisco. Jy 23

Mountain City Mining Company.—Location of Works: Cope District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of July, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. Jy 23

Noonday Silver Mining Company.—Location of Works: White Pine Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of July, 1870, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirteenth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. E. BUDGET, Secretary.
Office, Room 21, Hayward's Building, 419 California street, San Francisco, California. Jy 23

North America Consolidated Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of June, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventh day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Jy 23

Nevada Land and Mining Company.—Location of Works: Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of July, 1870, an assessment of one (1) cent per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, Room 5, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Thursday, the eleventh day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of August, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco, California. Jy 16

Pinto Mining Company, Location of Works: "Silverado," Pinto District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of July, 1870, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 426 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of August, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifteenth day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. B. BOWSMITH, Secretary.
Office, 426 Montgomery street. Jy 30

GIANT CEMENT. GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimony. Also, MINERS' RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in TIN CANS ONLY, with full directions. Taks no country. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by order from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT. MINERS' RUBBER CEMENT.

The Great Family Medicine of the Age.—THIRTY YEARS have elapsed since the introduction of the Pain Killer to the public, and yet at the present time it is more popular and commands a larger sale than ever before. Its popularity is not confined to this country alone; all over the world its beneficial effects in curing "the ill that flesh is heir to," are acknowledged and appreciated, and as a PAIN KILLER its fame is limited to no country, sect or race. It needs only to be known to be tried. THIRTY YEARS is certainly a long enough time to prove the efficacy of any medicine, and that the PAIN KILLER is deserving of all its propellers' claim for it is amply proved by the unparalleled popularity it has attained. It is a safe and effective remedy. Sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle. 4v21-1m

ORANDALL'S PATENT SPRING BED. COOLEY & GREEN, Proprietors.

Manufactory, corner Front and M streets, SACRAMENTO. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. Orders received at our manufactory, & at our agencies, as follows:

S. B. SNEDAKER, 413 Pine street and 639 Market, near New Montgomery. W. H. SABLES, San Jose. MR. NICHOLS, Stockton. IRWIN & GARNETT, Oakland. MR. MURPHY, Vallejo. E. A. TOMPKINS, Grass Valley.

HIBBERD, SANBORN & CO.,

South Point Mills, Berry Street, Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Jewels and Balusters.

DR. ABORN

Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Auzerais House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 5th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

DR. ABORN.—I take pleasure in bearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted. Oakland, June 3, 1870. WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patients to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon. James A. Johnson, M. C., Lieut. Governor Holden, Charles M. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases. 1v21-2m

DEWEY & CO.

San Francisco.

Scientific Press

U. S. & Foreign

PATENT AGENCY.

YOUNG & PAXSON,

July 30 No. 424 Montgomery St., San Francisco.

THE HOUSE WE LIVE IN.—The mind is the tenant of the body, and unless the tenement is kept in good repair, the mortal occupant is depressed, distraught, miserable, and sees things "as through a glass, darkly," not as they really are. When the stomach is relaxed, the liver torpid, the bowels disordered, and the nerves unstrung, invigorate, vitalize, regulate and tone them with TARRANT'S EFFERVESCENT SELTZER APERIENT. Its operation is certain, painless and salutary. It brings the action of these important organs into conformity with the laws of health; the spirits rise, the brain clears, and the capacity to enjoy life is restored to desponding invalids. SOLD BY ALL DRUGGISTS.

MARAVILLA COCOA.—For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For lunapaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

Machinery.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an obvious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,

Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patent, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-1f Supt. W. P. & C. M. Co., Philadelphia.

E. A. ARCHIBALD,

MANUFACTURER OF

Cast Iron Hubbed Wheels,
BY HIS PATENT PRESS PROCESS.

— ALSO —

Axles and Team Wagons of every Description.
METHUEN, MASS.

Particular attention given to Wheels for Portable
and Fire Engines.

All my Wheels have my name cast on the hub, and are made by my Patent Press Process. By this method the wheel is so compressed in every part that shrinkage or yielding of the part with all its attendant evils is wholly obviated, even in the driest climate. Any one understanding my process will be convinced of this. Send for illustrated circular.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at
the Paris Exposition.

Patented Nov. 1st, 1864; July
24, 1866; and Oct. 9, 1866.

ADAPTED

FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Crut Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.— They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

Mr. S. H. HERRING, agent for the Scientific Press, has called upon us, and is now in town. He informs us that the Press is rapidly increasing its circulation. We are pleased to hear it, for it is a Journal that all should read. Valuable to farmers as well as miners, mechanics and others.—*Fajeronian*, June 16th.

SILVER-PLATED
AMALGAMATING PLATES

FOR SAVING FINE GOLD.

SAN FRANCISCO

Gold and Silver Plating Works.

QUARTZ MILL MEN,

Miners, Hotel-keepers and Others,
ATTENTION!

The SAN FRANCISCO PLATING WORKS are prepared to furnish and silver-plate Copper Amalgamating Plates of all sizes, and in any quantities, at the very lowest rates. FULL WEIGHT OF SILVER deposited, and satisfaction guaranteed in every respect. Particular attention given to plating goods for BUILDERS, PLUMBERS and GUNSMITHS. OLD GOODS of all kinds re-plated for hotels, restaurants, etc.

The finest quality of Sheet Copper expressly for mining purposes furnished and cut to any size at the lowest rates. Full assortment of Plated Goods and Cutlery for sale at low rates.

San Francisco.

All work done at the lowest prices. 1v20-8m

HOWLAND PATENT ROTARY BATTERY

of 12 stamps. It requires no frame to put it up. Guaranteed to crush 1 1/2 to 3 tons per day to the stamp. The best Battery ever used for amalgamating gold, or crushing silver ores, dry or wet. Can be put up on a mine in running order for one-half the price of the straight battery, and in three days after its arrival at the mine. 12 stamp battery, 30,000 pounds, with frame complete, price \$3,000; 6-stamp battery, 8,000 pounds, price \$1,300. All prices named to be paid in currency. Every mill run at ship before shipping.

California Stamp Mills.

All the various styles of Pans, Amalgamators, Separators, Settlers, Concentrators, Dry or Wet for working Gold, Silver or Copper Ores, the same as built in California and at lower prices. SHOES AND DIES made of the best white iron. Send sizes and we will make patterns and forward Shoes and Dies at low prices. Engines, Boilers and fixtures, and other Machinery made to order. Also, Howland's Patent Rotary Valve Double or Single Engines.

Irons for the best California 10-stamp mill, straight battery, complete, \$1,600. Irons for low mortar, old style mill, much less. Send for a Circular.

Address

N. B.—Mr. W. H. HOWLAND, formerly of the Miners' Foundry, is now in San Francisco for a short time, and will receive orders for mining and other Machinery of Eastern manufacture at the lowest rates and most favorable terms. Orders may be left at S. W. HOWLAND & CO'S, 413 and 415 Mission street, between First and Fremont, San Francisco. 4v21-3m

FOR SALE.

Seven 16-foot by 54-inch Steam Rollers;
One 25-horse-power Steam Engine;
One Force Pump and one Air Pump;
One 3-foot Run of Stone, with Hux Frame,
Gearing and Pulleys Complete;
One lot of Shafting, Pulleys, Screws, etc.,
suitable for a Small Grist Mill;
Lot of Wooden Tanks, from 800 Gallons capacity
and upwards.

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

SCIENTIFIC PRESS, FROM SAN FRANCISCO
This Mining, Farming and Mechanic Arts Journal, after a most singular absence from our table, has again made its appearance and is heartily welcomed. It is the recognized mining organ of the Pacific coast, and rightly so, since it is conducted ably and honestly in all respects. It scorns humbug and avoids all merely speculative commendations of sudden discoveries in the treatment of ores. The reliability of the Press in all matters pertaining to mines and mining news, makes it a most desirable paper for our people here. Per annum, \$4.—*Colorado Herald*, July 6th.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY and MINERALOGY, 2—CIVIL ENGINEERING, 3—MECHANICAL ENGINEERING, 4—MINING ENGINEERING and METALLURGY, 5—AGRICULTURE, 6—NATURAL HISTORY and GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the Secretary of the Sheffield Scientific School, New Haven, Conn. 16-1y18p

ROASTING OF GOLD AND SILVER ORES,

—AND THE—

EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

By G. KUSTEL, Engineer and Metallurgist; author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of All Kinds of Ores." 145 pages, 12mo.
Illustrated by Numerous Engravings.

TABLE OF CONTENTS.

I. INTRODUCTION.

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effectuated; Means of Separating the Metals from Chloride.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Changes in Roasting.
B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverberatory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimney and Flues.

III. EXTRACTION OF SILVER BY LIXIVIATION.
C. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patena Process; Kiss Process; Patena and Rosner Process; Kustel and Hofmann Process; Augustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets.

Published and sold by DEWEY & CO., SCIENTIFIC PRESS OFFICE, 414 Clay street, San Francisco. Price, \$2.50 coin, or \$3 currency. Postage, 12 cents extra.

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for drying, and can be folded as compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

A NEW CORK EXTRACTOR.

This is a simple device of practical utility. It is adapted for Hotels, Saloons and family use. The tightest cork can be drawn with a mere nominal outlay of strength, and without any risk of bruising or hurting the hands. They will be furnished, plain or silver-plated, at manufacturing cost, to parties purchasing Rights. Any person of energy can soon realize the cost of a State Right by selling the Cork Extractors, as they sell readily and afford a large profit. Send for circular.

NEW LIGHT ON A NEW PRINCIPLE.

Gas for everybody in the city and in the country. Equal to coal gas at one-half the cost. The gas is generated and burned in a new style Vapor lamp. No wick, no chimney, no explosion; and no man who is out of business and has a few dollars should fail to purchase a County or State Right and commence making money. Parties owning territory get the Lamps at Manufacturer's prices. Call and examine the light, or write for particulars.

STEAM COOKER.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

SWIMMERTON'S MECHANICAL MOVEMENT.

Every steamboat should have a Pilot made on this principle. It is particularly adapted for the application of power to Steam propellers. Send for circular.

WIESTER & CO.,

314 Bush Street, San Francisco.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MOROAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint San Francisco, Cal., March 12, 1869—Messrs. A. S. Halliday & Co., Agents Morgan Crucible Co.—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

J. M. ECKFELDT, Assayer and Refiner, U. S. B. Mint.
Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Halliday & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.
Messrs. A. S. Halliday & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every not suitable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO., Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Halliday & Co.—Gentlemen:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adams, Gautier, and Taitouin, Mass. Yours are 5 to be not alone of more finished make, but to stand double or triple the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by

RIDER'S GOVERNOR CUT-OFF ENGINE,

Manufactured by the DELAMATER IRON WORKS, WEST THIRTIETH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more care than common engines. Note.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application. 26v20-3m16p

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, August 13, 1870.

VOLUME XXI.
Number 7.

A New Steam Ram and Marine Engine.

In the naval combats of the Ancients, the ram was often the decisive weapon.

ing shells, which can be fired by an electric wire in case the enemy should attempt to board. In action the vessel is submerged.

pivoted and working horizontally at opposite ends of the cylinder, C. The opposite arms of the bell-cranks stand at a slight angle to the rod, D, which should be made

forward on its sliding-frame. To move the cylinder, there is a wedge-shaped tongue, H, fastened beneath it and sliding in the ways, I, being moved by a long triple-headed screw, L, operated by a small independent engine. A pawl, J, and rack, K, on each side hold the cylinder at any required point.

The ram, M, is a steel tube, 24 feet long, 16 inches in diameter, and with an 8-inch bore, the outer end being tapered to an edge, and the bore decreasing for about eight inches from the outer end, so as to be easily cleared of obstructions by the shell. This tube extends out below the line of plating of vessels, being kept water tight by a stuffing-box. To load the apparatus, the movable breech, N, which is hinged, is thrown back, a shell placed in the receiving-chamber and pushed forward to the water cut-off, which closes the bore and is operated by a screw, n. Then N is closed and the key, i, inserted, forming a solid breech, the set-screw, m, bringing it down perfectly solid. The water cut-off is now raised and the shell is ready to be fired. An indicator, r, gives warning when the ram is approaching an opposing object.

The operating cylinder is four feet in diameter with an 8-foot stroke. When the indicator gives warning, the fuse of the shell is lighted and steam let on in the cylinder. This latter drives forward the piston and ram with enormous force, piercing a hole through the side of the opposing vessel, and at the same moment the shell is fired. The piston can make upward of forty strokes per minute, and, if desired, the side of the vessel may be pierced with many holes before separating. Or liquid fire or any other suitable material may be used in the tube.

The Engine.

The engine to be used on the vessel is an improved double-cylinder oscillating engine, which is likewise a new invention by the same gentleman, and which is illustrated in Fig. 2. There are two short cylinders, A, A, of large diameter, placed side by side, and operating together on the same pair of trunnions, which turn in the boxes, B, B'. Steam is admitted to the steam-chest, C, through the pipe, D, passing through the journal, and thence to the steam-chest through the passage, a, on the side of the chest. The exhaust steam is conveyed away by a similar arrangement on the opposite side. The valve-gear is operated by an eccentric, E, the rod of which hooks, in the present case, upon the pin, F, the starting lever, G, extending up from the eccentric arm, H. By introducing a link motion, the engine can be made reversible. A short shaft passes through the box, I, and carries a crank-arm, J, set at right angles with the arm, H. A pin from J enters a box in the frame, K, so that the motion of the eccentric raises and lowers this frame, which is guided in its move-

THOMAS HILL'S PATENT STEAM RAM.

With their means of offense and defense, a stout beam armed with iron and projecting from the forward part of the vessel was found most effective. This simple ram was naturally modified and changed in the course of years, and when gunpowder came into general use, it disappeared for a long time and was almost forgotten by the public. But iron armor and modern constructions have again brought back something of the ancient times, and the ram is once more a recognized weapon of offense. The weapon we illustrate to-day is an improved device, which uses steam power for piercing the sides of iron-clad or other vessels, and is the invention of a Californian. It consists of a ram (attached to a piston-rod operated by a steam cylinder) which projects from the bow of the vessel, and which is provided with a bore, through which a shell or other projectile can be fired, after it has been thrust through the opposing side. In the illustration, M is the ram, A, the bow of an iron-clad or other suitable vessel, and B, B, boxes for hold-

Inside of the vessel and near the bow of the same is a steam cylinder, C, which is provided with an ordinary slide-valve, operated by the rod, l. A yoke, d, has its op-

posite ends secured to the two ends of the rod, and a vertical lever, e, is attached to its center, by which the piston can be set in motion by hand. Secured to opposite ends of the valve stem are bent rods, f, extending to the arms of two bell-cranks, g,

Fig. 2.—HILL'S PATENT DIRECT-ACTING DOUBLE OSCILLATING ENGINE.

directions and operate the valve by alternately striking the arms of the bell-cranks, and by the connecting-levers the engine is reversed. The steam and exhaust pipes are both made to telescope, so that they allow the cylinder to be moved back or

forward on its sliding-frame. To move the cylinder, there is a wedge-shaped tongue, H, fastened beneath it and sliding in the ways, I, being moved by a long triple-headed screw, L, operated by a small independent engine. A pawl, J, and rack, K, on each side hold the cylinder at any required point.

ments by the arms, *m*, moving in the pots, *n*. A curved slot, *L*, extends across the top of the frame, *K*, the use of which will be shown hereafter.

Upon the top of the steam-chest are two standards, *b*, through the upper part of which extends a shaft, *M*. This shaft has a short crank-arm, *c*, whose pin, *e*, enters the curved slot, *L*, before mentioned. An arm, *N*, extends downward and enters a slot in the yoke, *O*. This yoke receives the ends of the valve-stem, *d*, which are keyed to it, so that the combined motion of the eccentric and the oscillations of the cylinders and steam-chest give the valve the proper motion, and, by changing the set of the arms, it may be made to cut off at any point in the stroke.

The pillow-blocks, on which the trunnions rest, are supported by a frame, *P*, at the ends of which are placed the pillow-blocks, *R*, of the two shafts, *S*, and the whole may rest on the bed-plate, *V*, at the bottom of the vessel. The cranks are so bent or cast as to form two parts, *e* and *f*, which stand at right angles to each other, and the two cranks, one on each shaft, stand in such relative positions, when connected to the piston-rods, that they balance and counteract the weight of each other in their revolutions. The two pistons have each a rod, *T*, extending entirely through the cylinder-head, *U*, at each end, and connected with the lugs, *g*, *g*, by keys. These lugs are forged with or fastened to the stub-ends, *h*. The straps, *i*, are provided with set-screws, *k*, by which they are made to work in exact equilibrium. No condensers are shown, but they may be used and air pumps connected.

By this construction the engine is made very compact, cheap, little liable to get out of order and very efficient. This and the ram, placed in a suitable iron-clad vessel and properly handled, would, apparently, make a most formidable adversary. Patents for the engine and ram have been granted, through the SCIENTIFIC PRESS Agency, to Mr. Thomas Hill, of this city, a gentleman who is well known for his mechanical talent. To him parties may apply for purchase of rights or any further information desired.

In addition to the above, Mr. Hill has invented a number of other valuable devices. Thus, he has made improvements in the link motion for steam-engines, and in the arrangement of the blades of screw-propellers. He has devised a projectile, consisting of a series of concentric shells, the compartments of which are filled with missiles and Greek fire, with a vial, containing an explosive, so arranged in the center, that, in striking an object, the vial will be broken, the inflammable liquid ignited, the shell exploded and the missiles hurled in every direction. Patents for the above are now pending.

WATERING PLANTS IN A DRY TIME.—In case of protracted drouth surface watering has a tendency to draw the roots to the surface, where the greatest amount of moisture is; and hence if the watering is neglected a single day, the roots will become dry, and the plant wilt.

To avoid this result, take a crow-bar or a wood stake, sharpened, and make among the plants numerous holes in the ground, six or eight inches deep; and into these pour the water from the nozzle of the watering-pot, the rose being removed. Give a heavy dose, and a half hour afterwards go over the ground with the hoe, stirring and levelling the surface, then attach the rose and sprinkle the plants and the ground very slightly. If this mode of treatment is properly applied once a week, plants will not suffer in any ordinary drouth.

EXPOSITION AND MINING REPORTS.—The six volumes of the Paris Exposition Reports, are printed and are in the binders hands. Prof. Blake is now making a general index to the whole series which will complete the series. . . . Commissioner Raymond's report on mining statistics is in the government press and will be published before long.

Communications.

IN THIS DEPARTMENT WE INVITE THE FREE DISCUSSION OF ALL PROPER SUBJECTS—CORRESPONDENTS ALONE BEING RESPONSIBLE FOR THE IDEAS THEY ADVANCE.

Eureka District, Nevada.

[Written for the Scientific Press.]

Eureka, or Napias, is one of the most prosperous districts which I have visited for some time. Napias, which signifies "silver," is its Post Office designation. The town is situated in a long cañon, and is now importing buildings from Hamilton, Shermantown, Elko, Carlin, etc., besides putting up new ones, at a rate which is decidedly rapid. Wells, Fargo & Co. have an office here, the U. S. Government has a Post Office, and Woodruff and Ennor run daily stages to and fro from various places. The population is increasing daily and I noticed many faces which I have before seen at White Pine. Skillman & Co. formerly of Shermantown, have started a weekly newspaper, the *Sentinel*, which is just what the people want.

The cañon, in which the town is situated, runs north and south, is very long, about half a mile wide, and is well supplied with water. There is enough wood for fuel in the neighborhood, but lumber for building purposes must be brought from the Truckee. There are now in the town some 400 houses, and the population is estimated at about 2000. There are 8 furnaces in full blast, and although the smoke and fumes which issue from them are decidedly disagreeable, yet to see them in action gives one most hopeful ideas with regard to the place. As you enter the town, you first see the three large stacks of the Eureka consolidated smelting works, next the Wallace and Bevan works (a Philadelphia company), next Col. Robbin's, then Carpenter & Co's, and finally, almost half a mile up, the Mercelina Co's works. Near by I see some new works are being built, one by a Chicago firm.

Money appears to be scarce here just now. I am told that the smelting works have much trouble in getting returns for the bullion they have shipped East. The camp has grown up on its own merits, and not a cent of capital has come in until of late.

The Formation.

The geological formation resembles somewhat that of White Pine. The limestone strata stand nearly vertical, and the whole district abounds in hills of nearly pure siliceous acid, or barren quartz, and also a species of gneiss, containing quartz, feldspar and mica. This rock is much used for building purposes, its contiguity to the town making it nearly as cheap as lumber. It is also used for the retaining walls of furnaces. The lining is made of a rock found in abundance at Pancake Mountain, twenty miles east of this place, and which is a sandstone containing a small proportion of alumina. This resists the heat as well as any known material, it is affirmed.

The mines are found chiefly in a mineral belt running about N. W. & S. E. as shown by the Tip Top Richmond Champion and Buckeye series, by the Great Republic, the Marcelina, the Adams, the Jackson, the Fulton, Cambria, Justice, on the north extremity of the belt, and by the Hometicket, Lord Byron, Dunderberg, Couelly, Hoodoo and Bodger, in the center, and again by the Basey, McCann and others, at the south extremity in Secret canon. This mineral belt is about a mile and a half wide, and all the mines of importance thus far discovered, are within its limits, excepting only the Kentuck and the Mountain Boy, which are apparently on another similar and parallel belt, some four miles westward of the great Eureka belt, and which has not yet been fully explored. Of the metals silver predominates; say, at a rough estimate, $\frac{1}{2}$ silver and $\frac{1}{4}$ gold, lead, antimony and zinc.

The Buckeye and Champion Mines.

I paid a visit to the three principal mines of the district:—The Buckeye, Champion and Jackson. The Buckeye was struck a little over a year ago, by six Cornishmen who have sold out their interest to Wm. M. Lent, of your city, for \$100,000, it is affirmed. The mines are situated on the west side of Ruby Hill, about $3\frac{1}{2}$ miles southwest of the town. Here in the limestone is a very large amount of carbonate of lead. The main deposit runs north and south, and in it the old company had sunk a number of shafts. The first one we went down, was 73 feet deep, in a solid mass of ore of the same character below as above. The next shaft was 55 feet down, and they have run a drift, some 55 feet, to connect with another shaft 63 feet distant. At this depth they have a chamber some 16 feet square, and good ore. How wide the body is they cannot tell. Tunnels run in 30 feet have not struck the country rock. There are some 1500 tons of ore on the dump, also, considerable galena. No men are at work at present, but a large force will soon be employed. The Sentinel, on the east slope, a No. 1 mine, is also owned by the Buckeye.

The Champion, is on the same belt, and the owners have consolidated with the Buckeye. There are four men at work who can take out sufficient ore for the present. Mr. W. J. Brown is the foreman.

We went in the large drift where the ore has been taken out during the past year. The room inside was from 20 to 25 feet wide, and braced with heavy timber. A drift was run in some 80 feet in the solid body of ore. The height of the open cut is about 30 feet, its width 16 feet, and its length over 35 feet, all in good ore. The deposit is covered with earth on the surface, about 4 to 6 feet deep. From the 2d, of April to the 11th, of July, six men, I am told, took out 1400 tons of ore.

Ore and Bullion Statistics.

From the Buckeye and Champion mines, there were extracted, between April 25th, and July 1st, 1,167 tons of ore which, in a 25 days run in 1 furnace and 41 days run in 2 furnaces, produced 374 tons of refined bullion. Shipped to Newark these were returned as worth about \$350 per ton. Estimating the cost of mining hauling and smelting, as not over \$25 per ton, while the cost of transporting the bullion from Eureka to Newark, and its separation and refining is a trifle less than \$75, there was a net profit of \$250 per ton, or \$93,500 on the whole amount in a little over two months. The two furnaces yield an average of over 6 tons of bullion per day. Such are the facts as given to me, and as generally stated up here. I will add that to transport ore or bullion to Palisade, costs \$30, and thence to San Francisco about \$16; total, \$46 per ton.

This enterprise, was started by Col. D. E. Buol and J. C. Bateman, in November last, when mining was in its infancy, and the town had no existence. The present condition of affairs speaks loudly enough in praise of them, and of the district. Messrs. B. & B. have interests in the Champion and Buckeye and two smelting furnaces, etc., etc. The same have recently passed into the hands of a San Francisco Company, the Eureka Consolidated, with a capital of \$5,000,000. The Trustees are Wm. M. Lent, J. C. Bateman, L. W. Cor, Gen. G. S. Dodge and W. Thompson Jr. The business of the company here is to be conducted by J. F. Boyd, as Superintendent.

I wish I could give your readers a fair idea of the immensity of the mineral deposits here. A few figures I have given, but these by no means represent the whole dimensions of the deposits, only what has been exposed, while much remains still unexplored. And then, looking at figures is not like looking at the masses themselves. I just advise people to come here and personally investigate. W. H. M. Eureka July 10.

[TO BE CONTINUED.]

THE DENVER PACIFIC RAILROAD was completed, on the 5th, inst. within 38 miles of Denver, and it was thought that the last rail would be laid this week. The Company is said to have sold, up to August 1st, 22,202 acres for \$85,116, or nearly \$4 per acre on the average.

Mineral Wealth of Utah.

[Written for the Scientific Press.]

EDS. PRESS.—It may be well to put on record the history of Utah's mineral resources. In or about 1864, Genl. P. E. Connor, was located here by order of the U. S. Government. He supposed, I presume, that as California, Idaho, Montana, Colorado, Arizona, and Nevada, surrounding us, all contained minerals of various sorts in abundance, Utah, so long neglected, was not "left out in the cold," and set men to work "exploring." Iron, lead, silver, gold, manganese, were then, and have been since, discovered. The policy of the men who had settled on this land, was to "have bold and use." copper, cobalt, etc., etc., for their own special benefit, and exclude all who differed from them in faith; hence, they used their influence to conceal our mineral wealth and discourage the development of this in this territory, assuring their followers that they would make more money raising wheat. So for a time there was no digging for the rich ore. The grasshoppers for a series of years have destroyed the seed and labor of the husbandman, have eaten up the expected crop: the people looking around for something to do, have discovered the vast amount of wealth hid in all the surrounding chains of mountains,—the Wasatch, Oquirrh, indeed, everywhere,—and they 'set have found out that ore can be sold for from \$30 to \$100 per ton, and that when dug and laid out on the side of the shaft or tunnel, the grasshoppers won't eat this result of their labor! These facts are patent now even to the Mormons, and hundreds have started out and are working; and soon their numbers will be thousands,—for they seem assured, if they will not get out the ores, many will come from the surrounding countries because of the abundance and richness of our ores, and they will be dug out, and thrown on the world's market for their value. This is all we desire, viz: That the precious metals so abundantly strown around us in these rich valleys, shall be taken out and made available to busy humanity. I have no objection to any man's creed. Let him worship whom or what he will. But I declare in all soberness, it seems to me folly, that men should starve when these mountains are full of rich mineral ores. T. D. Brown Salt Lake City August 4th, 1870.

CALIFORNIA AND ENGLISH WHEAT.—An interesting and important statement is incidentally made by a correspondent in to day's issue, in respect to the relative values of California and English wheat, in English markets, to the end that the best California wheat ranges in the English market, on an average, fully twenty-five per cent. above the average price of English wheat in the same market. Of course this increased value is due to the necessity for mixing with the moist English wheat a grain from some other region, which shall be sufficiently dry to take up, without serious injury to itself, the excess of moisture in the English grain. This end can be better attained with the California product than with any other. The general fact of the higher price of California wheat in the Liverpool market is well known; but that so great a premium is paid, we believe will be new to many, if not to most of our readers. It may safely be assumed that this important feature in California wheat will always secure for it, at least, a limited market in Liverpool, even when there is an excess in the European crops; because A No. 1 flour cannot be made from unmixed English wheat.

A Railroad from Wilmington to San Bernardino is talked of. The Central Pacific is said to favor the enterprise.

Mr. W. W. Foote, has retired from his position on the Oakland Transcript.

Mechanical Progress.

PURIFICATION OF COAL GAS.—In a paper recently read before the British Association of Gas Managers, Alfred Upward describes a plan devised by Mr. F. C. Hills for the economical purification of gas. We quote: "The plan is to make the ammoniacal liquor produced at gas-works of sufficient purity to become a cheap and effective purifying agent for depriving gas of its sulphuretted hydrogen and carbonic acid. The gas liquor made on the works, when purified, is run through the common scrubber, and the gas allowed to pass up through. The mode Mr. Hills employs to purify the gas liquor is as follows: He uses a series of stills or vessels placed one above another, which vessels are partly filled with the gas liquor to be purified. The gas liquor runs through these vessels by means of connecting pipes from the top to the bottom. In the bottom vessel the gas liquor is caused to boil. By this boiling the carbonic acid and sulphuretted hydrogen, in combination with the gas liquor, are driven off to a great extent, and also a little ammonia; these products are caused to pass into the liquor in the next vessel above, by which the ammonia vapour is mostly absorbed, but not the carbonic acid or sulphuretted hydrogen, and by passing these products in like manner through the whole series of vessels, the ammoniacal vapour driven off from the boiling gas liquor is absorbed by the gas liquor in the higher vessels, and the carbonic acid and sulphuretted hydrogen are left free to pass away wherever desired. The hot purified gas liquor, as it runs out, heats the cold gas liquor which is to be purified by passing in opposite directions through a series of pipes, so that very little heat is required."

ENGINE FOR STEAM YACHT.—*Engineering* illustrates and describes a compact double pair of engines just constructed for a twin-screw steam yacht of 40 feet length and 6 feet beam. These engines "occupy a space of 2 ft. 6 in. by 2 ft. only. The cylinders are $3\frac{1}{2}$ in in diameter by $3\frac{1}{2}$ in stroke, and the engines are intended to run at a speed of 550 revolutions per minute, and indicate 23 horse power. Each pair of engines drives a Griffith's propeller, 20 in in diameter, with 3 ft. 7 in. pitch, and one pair also drives a feed pump. All the working parts of the engine are of steel, and have large wearing surfaces, while each pair of cranks, crank shaft, and eccentrics are turned in a single piece. Each slide valve is driven by a single eccentric, which serves both for forward and backward gear, the eccentric strap having a link formed in one piece with it, and thus, while the throw of the eccentric is merely equal to the lap of the valve plus the lead, the necessary extra opening of the port is given by the oscillation of the link on its centre."

GOOD IRON FROM DOCKYARD REFUSE.—*The Colliery Guardian* says that Sir Antonio Brady has invented a process by which certain dockyard refuse, called "Seeley's pigs," largely contaminated with phosphorus and sulphur, and worth in the market \$11 or \$12 per ton, can, at a cost of \$9, be made into iron worth \$70 per ton. We quote: "The iron bears every test. One of the pieces exhibited had been beaten cold to the thinness of writing paper at one end, drawn to a point at the other, and then twisted by hand eight turns in an inch at a single heating. Massive bars had been beaten cold until the surfaces on each side of the head came into contact, and a plate six inches wide and half an inch thick had been beaten till its edges were in contact. In neither case was there any trace of a flaw either at the convexity of the curve, or at the concavity. Holes in a thick plate had been enlarged by driving cones into them, and, in a word, the iron had been knocked about in every possible way. At a very low estimate, it is worth £14 a ton."

AN UNCHANGEABLE MEASURE OF LENGTH. Beryl is proposed as the material for a standard measure. It is expanded by heat in a direction perpendicular to the principal axis, but contracts in the direction of the axis itself. "From this it follows that in every crystal of beryl, there must be a direction in which the expansion is equal to zero. Consequently a normal scale, cut from a beryl, would not be influenced by heat. The supply of material is abundant."—*Technologist*.

NEW SYSTEM OF LIGHTING.—M. d'Harcourt has received permission to try in Paris, says the *Engineer*, a new system of lighting by means of ordinary gas mixed with atmospheric air in fixed proportions, and projected on platinum. The inventor says: "Pure hydrogen gas, employed with the aid of a platinum cage, gives the same amount of light, volume for volume, as common gas burnt in the ordinary manner; but as coal gas produces by combustion three times the amount of heat as the same volume of hydrogen, it will be admitted that by employing the former simply to produce heat, and using its calorific value to raise the platinum to a white heat, as is done for hydrogen, a light three times, or at least twice, as powerful as that obtained with the common burners will be produced. Burners which consume not more than forty litres may be used, so that the new system allows of distribution of the light without loss, which is not the case with other methods of lighting. Not using the coal gas for lighting, but only to yield calorific, the poorest gas answers my purpose."

IMPROVED STEAM ENGINE.—An engine recently patented by J. C. Hoadley, "has its cylinder so constructed and located that the hot volatile products of combustion will pass in direct contact with the cylinder casting, around and partially jacketing it, in moving from the flue ends to the chimney. The invention also includes a novel arrangement of pipes for heating the feed-water within the smoke-box, between the flue outlets and the smoke jackets of the cylinder. Also, a steam gauge so connected by pipes and means for controlling the flow of steam through the same with the steam in the boiler, and with the steam in the pipe between the automatic regulator valve and the steam cylinder, that with the single gauge can be tested at will the pressure of the steam in either space."—*Artisan*.

RAIL-CARS WITH SIDE GALLERIES.—M. H. Desgranges, late Engineer in-chief of the South Austrian railways, has designed and constructed a carriage which has a passage-way on the outside. The object is to do away with the numerous unsatisfactory devices for communicating with the officers of the train, without the necessity of adopting the plan of a passage through the center of the car. This latter is, as everybody knows, a constant source of annoyance to the occupants, besides being not a little dangerous to invalids, who are thus subjected to frequent and sudden draughts of cold air.

VACUUM CHUCK.—A recently patented English contrivance for holding plates in the lathe while they are being surfaced "consists of a hollow chuck having a perforated face placed on a hollow lathe spindle, the rear end of which communicates, by means of an india-rubber pipe with a chamber in which a vacuum is maintained. The articles to be surfaced are simply placed against the perforated face of the chuck, when they are held by the pressure of the atmosphere on their outer sides. Provision is made for permitting the lathe spindle to revolve without interfering with the connexion with the vacuum chamber, and a cock is fitted for admitting air into the body of the chuck when it is desired to remove the article."

STEAM PAVIOR.—*The Pall Mall Gazette* describes a machine recently introduced in Paris to take the place of the clumsy old hand-maul in street paving. It consists of a small steam engine on wheels, drawn by one horse, to the rear of which is attached the "pavior," which is driven upon the ground with great force by a blow from the piston somewhat on the principle of a Nasmyth's steam-hammer. It slides on a bar some 6 feet long, and can thus be directed by the driver to any stone which requires forcing home.

NEW PLUMBER'S JOINT.—The new joint, invented by Isaac Smith, requires no solder, and is likely to soon supersede the present method of joining. It is made of brass, heavily tinned inside and out, and has conical ends, which fit into the pipe, and a central flange to which the heat is applied with a pair of hot tongs. This causes the tin on the outer surface of the joint to flow and this unites with the inner surface of the pipe, making a "sweated union" that no force can separate or water penetrate.—*Scientific Journal*.

Scientific Progress.

OZONE DEVELOPED BY FLOWERS.—*Nature* extracts from the proceedings of the Institute of Lombardy the result of Prof. Mantegazza's experiments on this subject. We give a portion:—The essences of mint, turpentine, cloves, lavender, bergamot, anise, juniper, lemon, fennel, nutmegs, capnut, thyme, cherry laurel, in contact with atmospheric oxygen in light, develop a very large quantity of ozone, equal if not superior in amount to that produced by phosphorus, by electricity, and by the decomposition of permanganate of potash. The flowers of the narcissus, hyacinth, mignonette, heliotrope, lily of the valley, &c., develop ozone in closed vessels. Flowers destitute of perfume do not develop it, and these which have but slight perfume develop it only in small quantities. As a corollary from these facts the professor recommends the use of flowers in marshy districts and in places infected with animal emanations, as the powerful oxidising influence of ozone may destroy them. The inhabitants of such regions should surround their houses with beds of the most odorous flowers.

CHEMISTRY AND MATTER.—In a notice of Prof. Naumann's work on Thermo Chemistry, by E. J. Mills, in *Nature*, we find the following:—"The existence of bodies having the same per-centage composition, but different reactions, is adduced to prove that the matter in them must be divided into discrete parts in each case. Does it not rather prove that matter has nothing whatever to do with chemical properties?" The progress of biology has repeatedly been opposed by an obstacle which, under the name of "mind," it has scarcely known how to treat, but with respect to which it is just beginning to find its true position. In like manner, physical science, and chemistry particularly, has had to encounter a phenomenon which, under the name of "matter," has continually impressed upon it the heaviest and most severe of theoretical burdens. It will be strange, indeed, if biology should steal a march on physics."

NORTH AMERICA AND EUROPE ONCE CONTINUOUS.—W. Boyd Dawkins, in *Nature*, says: "The forms of life common to Europe and North America imply a continuity of land between those now widely dissociated areas. Mr. Murray believes in the existence of a Miocene Atlantis, which has left the Sargasso sea as a palpable monument of its existence in the mid-ocean. I should, however, be rather inclined to look for the continuity of land in the direction of Siberia, Behring's Straits, and, it may be, Greenland; and when the recent wonderful discoveries of temperate and sub-tropical vegetation in the now Arctic regions is taken into account, it appears to me extremely probable that the animals migrated from one area to the other by that pathway. But whether this be accepted or not, Prof. Heer has shown that during the Miocene times there was a vast extent of land, and a temperate climate in the now extremely high northern latitudes, which would imply conditions of life favourable for the migration of the Miocene animals."

GALVANIZATION OF THE SYMPATHETIC NERVE.—*The Journal of Psychological Medicine* for July contains an interesting article by Doctors Rockwell and Beard upon the physiological effects produced by galvanization of the sympathetic nerve. We quote a single paragraph, which is sufficient to suggest the possibility that valuable results may follow further investigation.

"In order to determine the effect of galvanization of the cervical sympathetic on the cerebral circulation, we have instituted a number of experiments on our own persons. The positive electrode connected with a galvanic battery of twenty Större's cells was placed in the right auriculo-maxillary fossa, and the negative between the sixth and seventh cervical vertebrae. Dr. St. John Roosa examined the retina with the ophthalmoscope, just before, during, and about five minutes succeeding the applications. During the passing of the current, Dr. Roosa observed that the arteries of the retina increased in size, and that more vessels were brought into view. The applications were continued from two to five minutes. On examining the condition of the retina about five minutes after the application had ceased, a marked decrease was observed in the size and number of the arteries. It was evident that the secondary effect of the galvanization was to produce anemia of the retina, since it presented fewer and smaller blood-vessels than before the application."

VARIETIES OF CARBON.—M. Berthelot in a recent paper upon this subject, commences by pointing out the specific heats of five different kinds of carbon, and comparing them with the specific heat of the element as deduced from that of its gaseous compounds, and shows that the relations between specific heat and atomic weight are not the same as those observed in the case of other elements. He then explains his process for distinguishing and separating the varieties of carbon by treatment with nitric acid and potassic chlorate, and describes the products obtained from carbons of different origin, enumerating no less than thirteen different varieties of the element. The next two sections describe the effects of various agents on carbon, and the carbon obtained from different compounds; concluding with the observation that the kinds of carbon differ so widely in their properties, re-action, and specific heats as almost to warrant their being considered as different elements.

LARGE INDUCTION COIL FOR DARTMOUTH.—*The Journal of the Franklin Institute* says: "An induction coil of great power has recently been constructed by Ritchie & Sen, of Boston, for Dartmouth College, the most powerful one at present in the country. It has not yet been tried with a battery sufficient to develop its force, but has given a torrent of sparks of between 19 and 20 inches in length, when excited by the battery of 24 pairs of large zinc and iron plates immersed in dilute sulphuric acid, which is used by Mr. Ritchie in magnetizing compass needles and other similar work. With 9 cups of medium-sized Bunsen elements, arranged 3 x 3, it gives an 18 inch spark; with a single cup it gives 6 inches. The apparatus consists, really, of two independent coils, which are placed on the same base, with their axes horizontal and coincident, and are capable of being used separately or in combination. Either section alone gives, readily, a 12-inch spark. They can be combined for quantity, giving in this case, of course, no greater length of spark than when used singly, but producing luminous effects of remarkable beauty; or for intensity, and in this way the long sparks, spoken of above, are obtained. The length of each section is 15 inches, and its diameter 8; the whole machine being a little over 3 feet long. The cores of fine annealed iron wire weight 11 pounds; the primary coils are of copper wire, $\frac{1}{8}$ of an inch in diameter and 185 feet long; the secondary coil is of wire 9-1000 of an inch in diameter and 183,000 feet long, or very nearly 35 miles."

ELECTRIC QUANTITY AND ELECTRIC INTENSITY.—The following is an extract from a recent lecture by Prof. Tyndall, at the Royal Institution: "Faraday immersed two wires, the one of zinc and the other of platinum, each one one-thirtieth of an inch in diameter, in a cell of acidulated water. The depth of immersion was only five-eighths of an inch, and the time of immersion only three-twentieths of a second. Still he found that the electricity generated by this small apparatus in this brief time produced a distinctly greater effect upon a magnetic needle than twenty-eight turns of the large electric machine of the Royal Institution. A cubic inch of air, if compressed with sufficient power may be able to rupture a very rigid envelope; while a cubic yard of air, if not so compressed, may exert but a feeble pressure upon the surfaces which bound it. Now the electricity of the machine is in a condition analogous to the compressed air. Its density, or, as it is sometimes called, its intensity, or tension, is great. The electricity from the voltaic battery, on the other hand, resembles the uncompressible air. It exceeds enormously in quantity that from the machine; but it falls enormously below it in intensity. The deflection of a magnetic needle and other actions of the voltaic current depend solely upon quantity, hence the vast superiority of the voltaic current in producing such deflection. Faraday found the quantity of electricity discharged by the decomposition of a single grain of water in a voltaic cell to be equal to that liberated in 800,000 discharges of the great Leyden battery of the Royal Institution. This, if concentrated in a single discharge, would be equal to a great flash of lightning. He also estimated the quantity of electricity liberated by the chemical action of a single grain of water on four grains of zinc to be equal in quantity to that of a powerful thunderstorm. Weber and Kohlrausch have found that the quantity of electricity associated with one milligramme of hydrogen in water, if diffused over a cloud 1,000 metres above the earth, would exert upon an equal quantity of the opposite electricity at the earth's surface an attractive force of 2,268,000 kilogrammas."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

TARSHISH.—*Miner*, July 30: Ore is now found in the face of the work in both claims on the Tarshish lode south of the Schenectady, the Monitor No. 3 and Silver Glance.

AMADOR COUNTY.

ONEIDA.—*Ledger*, Aug. 6th: A new Supt. has been appointed. Everything is in order; the mill is in perfect condition; the shafts are down eight hundred feet and timbered in a substantial manner, and are producing a large amount of quartz.

BUTTE COUNTY.

FORESTOWN.—*Oroville Record*, 6th: Roberts & Co., on Ohio Flat, have cleaned up \$3,000. Bowers & Gaskill have been at work for three years running a bed rock tunnel, and a small space of their claim having yielded some two hundred ounces, they are confident of realizing \$20,000 on the first clean up.

CALAVERAS COUNTY.

NEW MILL.—*Chronicle*, 6th: The Lewis Bros. are erecting a mill upon their mine near Railroad Flat. The battery will be of five stamps. Only the inferior rock will be crushed, the higher grade ore being conveyed to Thoss mill, at West Point. The Co. intend to have the stamps in operation within a couple of weeks. We have it from the best authority that rock of unexampled richness is being taken out.

INYO COUNTY.

CERRO GORDO.—A Los Angeles telegram of Aug. 8th, says: Upwards of 40 tons of bullion from the Belshaw mine goes up by steamer to-morrow.

LOS ANGELES COUNTY.

TELEGRAM, July 31st: Small lots of fine gold received from San Francisco Cañon. More men are working than at any time since the first gold was taken from there, long before the discovery of 1848.

PLUMAS COUNTY.

BIG STRIKE.—The Marysville *Appeal*, of Aug. 4th, says, The Union mine has discovered the Mother lode or extension of the Kettle and Crescent. Great excitement prevails in the vicinity. The ledges opened vary from 10 to 25 feet in thickness.

PLACER COUNTY.

NINETEEN THOUSAND DOLLAR CHUNK.—The Rattlesnake Bar correspondent of the *Star & Stripes*, Aug. 4th, says a piece of quartz and gold has been found in Baltimore Ravine by some Austrians who kept it secret, and have now sent it to the city. The piece weighed 106 pounds: quartz, nine pounds, leaving gold ninety-seven pounds.

The journal aforesaid remarks upon this:—The monster nugget was found upon or near the surface, in a ravine which "has been worked over and over, from mouth to head, dozens and dozens of times, and has as often been considered exhausted."

ST. PATRICK.—We saw on Thursday the finest specimens we have met in our 20 years California life, taken from the drift in the St. Patrick, ten feet from the shaft, now down 128 feet. It was 10 or 12 inches square, 4 to 6 inches thick, and was uniformly covered with fine gold. No doubt can be entertained of the permanence of the St. Patrick. The Mallet mine gives equally favorable indications.

GOLD RUN.—Correspondent of same: The Golden Gate and Church combined, and the Karney claim, have had a clean-up, resulting in an increase of thirty-three per cent. over the previous one. They are now cutting down the top of their tunnel, using 24-inch nozzles with a pressure of 3 feet. The main supply pipe of each is 3,000 feet long, varying from 80 inches at the head to 16 inches at distributor. The Dutch Flat claim, are still pushing their big tunnel ahead and expect to be ready against next season. Brogan & Hoskin, of the Cedar, are about to start their tunnel again. U. S. Wolcott, at the head of the miners' ditch running an extension to the South Yuba, will be through in three or four months. The Buckeye Company, T. Hoos, and some other companies, have done exceedingly well this season. The Oak and Cedar Co. have again commenced prospecting. Last week they were taking out cement in which gold was plentiful. Kelsey & Co. are prospecting a quartz ledge in Squires Canon, and got rock on the top worth nearly a dollar per pound, but as quartz gets more plentiful gold gets scarcer. Mr. Palmatag, is about to open the old Pete Sheeler claim. Philipps & Co., of the Central, are to run a tunnel to get forty feet deeper.

THAT NUGGET.—The Grass Valley *Union* of the 6th, says the report of the discovery of a \$19,000 nugget by an Austrian in Baltimore ravine arose from the fact that two Turks found some good quartz; and so far as it can ascertain the truth, it amounts to nothing more.

The same says the St. Patrick mine, near Ophir, has been sold to George D. Roberts and J. W. Gashwiler of San Francisco.

The Auburn *Herald* of Aug. 6th, says the St. Patrick has been sold to the same parties who bargained for it in June, viz: Capt. Lee, Melville Atwood, Cornise & Co. The claim has passed into the hands of the new owners.

The same says that Simons & Co. had 21 tons of quartz crushed at Empire mill, which yielded \$26 per ton.

PLUMAS COUNTY.

UNION.—This name has been given to the lode recently discovered near Greenville, Indian Valley. It has been sought for by two different parties, of these the latter was H. C. Bidwell, who spent some \$200 in sinking a 290 feet shaft. One year ago, he contracted with J. R. Drury to continue prospecting for the lode, had Mr. D. progressed six hundred feet into the hill without striking anything. Coming back three hundred feet, he started a cross tunnel; when in 50 feet, he struck the vein, which is 14 feet wide, well defined, and shows free gold all through it.

JAMISON AND VICINITY.—An old friend writing from the 76 Mine says:—“The Mammoth have let a contract for running their main tunnel one hundred feet further to open the Eureka chimney, the largest body of ore in the mountain. There are men engaged at Eureka in putting up Chlorination Works, to work the sulphurets.

NEVADA COUNTY.

EUREKA MINE.—Grass Valley *Union*, Aug. 3d. The Eureka yesterday had another melting. The returns from the mill, for 12 days run, were \$28,000 worth of gold bars. The next run will not be so large, since water has become so scarce that ten stamps will have to be hung up. Underground appearances are better than ever.

MEADOW LAKE.—The revival has not yet commenced. So the Assessor says. S. E. Squire & Co. however, are about to work the Grant mine, near Carlisle, and think of putting up a ten stamp mill.

BRANCH MINT.—Same of Aug. 4th: This company have let a third contract, for 100 feet of tunnel, which will make 425 feet into their claims, with 125 feet "backs."

GREEN MOUNTAIN.—Same of 9th: Yesterday a crushing of thirty-four loads was completed and the yield was \$6,512, at \$16 per ounce. The rock was taken out by thirteen men in eleven days.

PERRIN'S MINE.—The four weeks run concluded Saturday, gives a good return. The total yield for the four weeks is \$9,600. Expenses at the mine for the time, \$4,402, and at the mill \$1,203, total \$5,605, leaving a profit of \$3,995. The rock crushed amounted to 410 tons, averaging \$23 40 to the ton.

LARGE CHUNKS.—*Gazette*, 6th: A nugget was picked up yesterday in Fuller & Bowman's claims, Omega, worth \$117. Several other pieces worth from \$10 to \$15 were found.

IN MOTION.—Same of 8th: Stile's new hoisting works were put in motion on Saturday. The pumping and hoisting is done by water power. The incline is down sixty feet. The vein fills the entire face of the incline. Over a thousand tons of rock has already been taken from the ledge at a profit.

KANSAS.—We are informed that rich gravel was reached in the mine last week.

PITTSBURG.—*Transcript*, 9th: In the last two runs of the mill, one of seven days and the other of six, the aggregate yield was over \$12,000—very nearly a thousand dollars a day. The mill has only ten stamps.

NORTH SAN JUAN.—A half interest in the Amokeg Co's claims, was sold by J. Downey to Bowen & Davis, on the 8th, for, \$1,200. There are now four companies at work on the hill, all doing well.

ITEMS.—*Transcript*, Aug. 2d: Rich strike in Mulberry ledge, on Gold Flat. . . . The Lindley is fast gaining the reputation of a first class mine. The ore does not pay largely, but the yield is regular, and the ledge is of great size, being from eight to twelve feet in width. They talk of a 40 stamp mill. . . . The U. S. Grant mine has been leased to Squire & Co. for three years. . . . The Star Co. are running their 8 stamp mill night and day, on work from Orleans ledge.

SEVEN-THIRTY MINE.—Grass Valley *Union*, 10th: We saw yesterday a candle box of specimens just arrived from the

Seven-thirty. Three of these, not one of which was larger than a hen's egg, were valued in the aggregate at \$180. The box of specimens was considered worth \$2,000.

SAN DIEGO COUNTY.

A Los Angeles telegram of July 31st, says: The recent survey of the Cuyamaca

Grant was made in the interest of the miners of Julian District. It is claimed that they show the District to be five miles north, beyond the extreme limit of the grant. The mines are reported showing well, and new quartz mills are going up.

MILLS.—*Union*, July 28th: Martin & Bett, and also Shepherd & Flagg, will put up mills at once. The Skidmore Co. will have a 5-stamp mill running in three weeks.

SHASTA COUNTY.

STRUCK IR.—*Courier*, Aug. 6th: Horace Green, who recently opened a claim on the Banghart lead, Mad Mule creek, has struck the pay streak and taken out \$12 to the pan. We understand that Banghart, who owns the first claim located on the land, has been taking out gold at the rate of an ounce per day.

SISKIYOU COUNTY.

COTTONWOOD.—*Yreka Union*, Aug. 3d: The Sam Richardson and Bill Smith claim, for the six weeks preceding the 16th of July, took out \$5,000, four men working. The quartz mill at Cottonwood has made a short run, crushing 48 tons from the Norfolk ledge, which averaged between \$22 and \$23 to the ton.

PITT RIVER REGION.—From Mr. Sharp, who returned from surveying a road in Big Valley, we learn that mines have been struck in the mountains, eight miles south of Adin, and that thirty persons are at work.

TULARE COUNTY.

NEW DISCOVERY.—*Visalia Delta*, Aug. 3: We have been shown specimens of silver ore discovered on the divide between the waters of Tule and Kern rivers. Several assays have been made, running from \$75 to \$150. The specimens are from a depth of 12 feet, and the ledge is well defined. The district has been laid off and a code of laws adopted.

TUOLUMNE COUNTY.

OMEGA TUNNEL.—*Sonora Democrat*, August 6th. The tunnel is nearly through the rim rock, the work having been going on 18 months. In "51" a shaft sunk from the top of the mountain prospecting \$2.50 per ton. Hughes claim and the Humbug just above are paying well.

A PROMISING VEIN.—On the west side of Table Mountain, Mr. Newton and another have developed a quartz vein twelve feet in width; of this, three feet is first-class paying ore; and prospects at the rate of one thousand dollars a ton.

ITEMS.—On the Blue Gulch lead near Chinese Camp a tunnel being run from the bottom of the ravine, will tap the vein many feet lower than heretofore and will cost \$30,000.

B. F. Heslep has purchased the Quartz Mill on Bald Mountain, to put on his lead at Quartz Mountain.

Totten and Griffin are sinking three hundred feet deep on the App vein.

Arizona.

BIG BUG.—*Prescott Miner*, July 23d: The latest news is good. The mill was running and the lode showed better than ever.

RICH ROCK.—Mr. Frink, of the Vulture, last week showed us some very rich pieces of ore from the bottom of the deep shaft. The mill was running satisfactorily.

LYNN CREEK.—C. Y. Shelton has indeed struck it rich in the Vernon. Out of a little more than two and a half tons of rock, crushed in his arrastra, he obtained two pounds and three ounces of clear gold, worth \$17 per ounce! And he has plenty of the same kind of rock left. Uncle Billy Pointer is getting out rock very rich in ree gold.

Colorado.

ITEMS.—*Central City Register*, Aug. 3d: West level in the Seaton is 74 feet from the whim shaft. The crevice is ten feet between walls, and carries rich mineral. . . . Sam. Allen brought to mill at Montezuma 1,500 pounds ore from the Register o'e. After crushing and sampling, it yielded by assay 78.5 ounces of silver. . . . About 18 cords of ore per week are sent to the stamp mill from the Consolidated Bobtail mine. . . . Seven to ten tons are weekly shipped from Grand Island District, mostly from the C. ribbo mine. . . . Alex. Cameron retorted 57 ounces of gold from his mines on North Clear Creek last week. . . . A specimen from "No Name" ledge, Grand Island, assayed 318 ozs. silver per ton. Joseph Shaw is the owner. The crevice is three

feet wide. . . . The Grass Valley Mining Co. are running 77 stamps on Rhoderick Dhu and prize ore. . . . The Western Smelting Co.'s works at North Clear Creek will soon be in operation.

WARD DISTRICT.—*Boulder News*, 3d: The Niwot mill is running on old wall rock that had been thrown away, taking out more money than it has done for the last two years. . . . Williams & Co. are running the Long Peak mill, and doing well. . . . Hoover, Carson and Hodges are sluicing the Columbia on Niwot Hill, and taking out \$6 a day to the man.

JIM CREEK.—John Keen and Charley Stewart are running four arrastras, on ore from the Blue Jay. . . . Jack Virdin is running two arrastras. . . . Charley Davis is working the Blue Jay.

GRAND ISLAND.—Carter & Co., on the east extension of the Boulder County lode, are sinking two shafts, 500 feet apart, and have 15 to 18 inches of good ore.

TERRIBLE.—*Georgetown Miner*, July 28: The Supt.'s report for April, May and June shows that the second-class ore has more than paid all expense of work done at the mine. The value of the first-class ore shipped to England, and now ready for shipment, is \$24,375. The average yield of the first lot shipped was 500 ozs. per ton. Value of third-class ore on hand, less the cost of treatment, \$8,625. Total profit for the first quarter, \$33,000, or \$11,000 per month.

CASHIER.—At the bottom of the shaft, 60 feet deep, the vein is 8 feet wide between easings. Thirteen tons average ore gave a yield of \$135 per ton. The first-class ore yields \$450.

SUMMIT.—There are 75 men placer mining in Union District. . . . Hiff, Pollock & Co. have struck bed rock in French Gulch, and it pans out rich. . . . Mr. Martin was the finder of an unget weighing ten ounces, near Lincoln.

ITEMS.—Snow Drift ore specimen gave by assay \$1,950 per ton. . . . First-class Quaker ore, Sherman Mountain, milled \$210 per ton. . . . The Brown & Coin are producing very rich ore. The Brown Co. have men at work.

Idaho.

YUBA DISTRICT.—*Statesman*, Aug. 2d: We learn from Dr. Bishop, who has just arrived from England, that a wealthy company has been organized in London for developing the Atlanta Ledge. It is the intention to erect a twenty stamp mill at once.

Mining on the Boise river is nearly suspended for the season. A few claims are still being worked at good wages.

ITEMS.—*Avalanche*, July 30th: The McMahon Bros. are taking ore out of their 30-foot shaft at Red Mountain, which shows free gold largely. . . . Thirty-five tons Empire ore recently worked at the Cosmo mill. . . . Pete Nick takes ten tons daily out of the Mahogany. . . . Golden Chariot vein is still as large and rich as ever. . . . Rich ore still coming out of the Morning Star. . . . Capt. Myrich has purchased the Ainsworth quartz mill, and intends to work surplus Oro Fino ore with it. . . . Same of Aug. 6th: W. F. & Co., ship \$14,000 Owyhee bullion to San Francisco this morning. . . . W. R. McDaniel has bonded the Long Gulch

SNAKE RIVER.—Wm. R. Usher returned from the mines on Sunday. He reports good diggings, but not enough for half the people. He says there are 600 men in and around the mines.

Montana.

PILGRIM'S BAR.—*Helena Gazette*, August 1st, Blair's first clean up after a run of five weeks, was \$5,500, Holcombe, Berry & Co. made a clean-up of \$6,700 for seven days run.

PIKES PEAK.—Capt. Eastin, Maj. Irvin and Mr. Fly sold their grounds on Dry Gulch for \$2,800. Steel, Ketchum & Co. cleaned up \$5,000 last week. Holcomb, Roe & Berry \$6,080; Rodgers & Co. \$3,000. Col. Blakeley & Co. will soon be on bed-rock I W. Morrison & Co. \$3,000. The camp turns out \$25,000 every week.

PHILLIPSBURG.—Cor. of same: Merrill and Ulery are one hundred and six feet down—have cut the vein five feet thick. The quartz, averaged \$40 per ton. The Saunders Co. have placed their furnace under the supervision of two White Pine men. On Monday the trial run will be commenced.

The Cameron mill is still running, with plenty of rich ore.

At Georgetown, Jimerson has struck bedrock and is taking out from fifty to sixty dollars a day to the man. Coleman and Fishbee four mills east have completed three arrastras. Mr. C. thinks from tests made of the ore it will average fifteen or twenty dollars.

RADERSBERG.—Cor. of same Quinn & Keating, on Crow Creek, cleaned up \$1,604 for six day's run, four men shoveling. Quinn & Howe cleaned up \$800, or one week's ground shoveling, for four men. Several claims are paying \$5 to \$8 per day to the man.

HIGHLAND.—New North-West, July 10th The Only Chance Co., have purchased the Ledoux saw mill and will attach two arastra beds to the wheel—making ten beds running. They are now 275 feet below the surface in their main shaft.

Harvey, Day and Co., Moose Creek, will have their arastra running in two weeks.

CIDAR CREEK.—From 1,000 to 1,200 men are mining. 100 sluices now running. The gulch is yielding from \$3 to \$40 per day to the hand. The claims opened will average wages. The ground is principally the shallow cañons. The deep ground is the reliance of the camp.

ITEMS—Independent, July 30th: Johnson & Prior, at Snowshoe Gulch, have discovered a bar that pays \$50 a day to the man.

DIAMOND.—The water is low and miners are just getting into the gulch. Stafford & Co., of Cañon Ferry, have 27 men at work on their ditch extension, and will have a supply of water into the foot-hills of Cave gulch by the middle of August.

New Mexico.

ITEMS—Press and Telegraph, July 23d: The Atzee mill on Ute is paying large dividends.

GROUSE GULCH.—Bowers & Pollock cleaned up from a six day's run, 95 ounces of gold.

Eight companies are at work taking out 300 ounces per week. Since the ditch has been running there have been three clean ups on the claim of Calhoun Deane and Sullivan, netting 187 ounces. Five days and two nights run the present week realized 79 ounces and 9 pwt.

Same of July 30th, The Chester Quartz Mill has been running 20 stamps during the week. Spanish Bar for weeks has been running over its range of \$6 per man.

THE MAXWELL GRANT.—The deed of sale has been recorded. The sum named is \$1,350,000.

PETROLEUM IN INDIA.—Mr. B. S. Lyman, of Philadelphia, who was sent for by the British Government to explore the petroleum deposits of India, has written home several private letters, which are conlensed in the "Mining Register." The rocks in the Punjab, whence Mr. L. wrote, are cretaceous and tertiary, and the oil seems to be in the same formation as that of the petroleum belt of Italy along the north and east foot of the Apennines, from Pavia in the Po valley to Bari and Brindisi on the Adriatic. The Italian wells have never yielded more than a few gallons per day. Mr. Lyman says that, in the Punjab, the oil places are all quite separate from each other and often many miles apart. The deposits are very limited, from a few feet to a few score yards, at most. The dips are steep, seldom less than 45°. The oil, or rather the tar, oozes from bituminous spots in a sand rock some 50 feet thick; also from similar spots in a very coarse conglomerate, nearly as thick, above it; dip only about 25°. Several wells are being sunk. The best yield yet is 5 or 6 gallons per day, at Gunda.

THE UNION COPPER MINE SUIT has been decided by the Supreme Court of the State in favor of the plaintiff, who recovers two-thirteenths of the mine, and judgment for \$125,598. This names of the wife and daughter of one of the discoverers of the mine were put in the list of owners posted on the claim. These names were afterwards omitted, and the persons thereafter treated as having no interest in the mine. The daughter, then a minor, with no knowledge of the use of her name, brought suit to recover. The court held that when a title to a claim has been vested in a person under the mining customs, it cannot be taken away except by due process of law, the same as if a deed were recorded, giving real estate to a child, in which case the deed cannot be afterwards taken back.

IRON.—The Folsom Telegraph has been informed that an iron mine has been discovered in El Dorado county, in the hills between Jayhawk and Green Valley.

San Francisco Stock Market Review.

MISCELLANEOUS STOCKS.

During the past week, sales of Spring Valley Water Co. stock were made at \$68 25 per share. —The Union Pacific Salt Co. disbursed a dividend of $\frac{3}{4}$ per cent. on the 10th inst. —A dividend of $1\frac{1}{2}$ per cent. is announced by the California Trust Co. for the current month. From the usual monthly statement of the Company, for the month of July, 1870, we take the following:

Capital Stock paid in.....	\$300,000 00
Surplus earnings.....	61,040 88
Cash on hand.....	117,057 29
Loans outstanding.....	512,343 77
Deposits with Company.....	572,453 83
Sales, Furniture, etc.....	5,041 63
Dividends uncollected.....	958 00
Dividends declared since January, 1870.....	21,875 00

From the annual report of the Secretary of the California Insurance Co. we obtain the following totals: Receipts, \$231,928; disbursements, \$138,950. Assets July 30, 1870: \$374,777; liabilities, including reinsurance, \$46,904—surplus, \$327,873. Dividends, \$30,000; profits, \$71,213. A dividend of 1 per cent. per month is now payable. The following officers have been elected for the ensuing year: Directors, Alpheus Bull, Jerome Lincoln, W. C. Talbot, Judah Baker, Jr., Thomas R. Hayes, Wm. Scholle, Samuel Merritt; President, C. T. Hopkins; Vice-President, H. B. Tichear; Secretary, Zenas Crowell.—The People's Insurance Co. disbursed their customary 1 per cent. dividend on the 10th inst.

The following quotations have been carefully revised by F. H. Woods, Broker:

MINING SHARE MARKET.

A marked activity manifested itself during the past week in a number of prominent stocks on the list of the Board, resulting in largely augmented aggregate sales as compared with a like period for some time past. The leading stocks have been Savage, Ophir, Yellow Jacket, and Original Hidden Treasure, most of them showing a slight recession at the close. There is an improved disposition upon the part of outsiders to enter the market, mostly brought about by a more than usual speculative movement in which all dealers wish to participate. White Pine looks more hopeful, and reports are more promising. The quarterly reports to the Assessor of two leading mines are as follows: South Aurora—reduced 2,833 tons of ore, showing a hullion return of \$133,982, equal to \$47 29 per ton; and Original Hidden Treasure—reduced 2,472 tons, yielding \$119,425 in hullion, or \$48 31 per ton. For the week ending August 6th, hullion amounting to \$39,139 was sent to San Francisco from White Pine, and \$12,358 to New York.

CHOLLAR-POTOSI—has been in the market at a good figure. During the week closing August 6th, 1,700 tons of ore were mined, showing an average assay value of \$68 10 per ton; previous week 1,580 tons were produced. This affords great encouragement to stock dealers, as all the ore-producing sections give promising results for the future. At present the track floor of the Potosi Tunnel, going south in the Belvidere section, is reported to exhibit excellent ore. A dividend of \$2 per share is payable since the 10th inst. The hullion product for the month of July aggregates \$261,227, against \$215,548 in June.

Commercial Herald.

The French Ministry has been obliged to resign. A new one has been appointed. Paris is greatly excited. Parisians will please keep quiet for two days.

Salt Works in Alameda County.

The amount of common salt used yearly is increasing as the developments of chemical science advance the demands of civilization. Salt is not only indispensable as a condiment, and in the curing and preserving of meats, butter, etc., but is also largely employed in roasting ores and for fertilizing purposes. For preserving articles of food purity is also indispensable.

The great abundance of salt existing in nature is indicative of its importance. Without it, the ocean would be one vast sea of corruption, intolerable to human life. In many places in the world immense beds or strata of salt are found and extensively mined. The largest one known is in Poland, which underlies quite a large tract of country and is over a thousand feet deep.

The manufacture of sea salt is quite an extensive business in some parts of the world. On the Atlantic States coast, where it once flourished, but little attention is now given it. The numerous brine springs in Michigan, Ohio, Kentucky, Virginia and New York yield an immense quantity of good salt, which is appropriated by manufacturers. On the Pacific coast there are also many salt, alkaline and mineral springs, some of which will eventually prove of value to the manufacturer.

In New Mexico, Arizona, Nevada and Utah some very extensive fields of salt, soda, &c., the accumulated product of springs, await the demands of man. Several of these deposits are now worked for the use of miners, etc.

The interior alkaline deserts of this country contain untold wealth in fertilizing materials, could it but be placed within reach of the Eastern agriculturists. Salt enters largely into the composition of the alkalis on these desert plains. But we designed more especially to notice, in this connection,

The Salt Interests in Alameda County.

Between the towns of San Leandro and Harrisburg there are immense fields of marsh land, mostly grown over with grass, with many natural, shallow ponds or basins of considerable extent, and which are under water at high tide. These flats are divided by several streams which are navigable for small vessels at high tide. The clayey, compact nature of the adobe soil is admirably adapted to the clean deposit and easy gathering of the salt.

In preparing these basins for the manufacturing of salt, it is only necessary to throw up small dykes from one to three feet high. Several flats are so inclosed, of such size as may appear convenient, and communicating with each other. The water is first let into one of these, where it is allowed to settle and evaporate for several days, when it is conducted into a second basin and evaporated by the sun and wind until it is a strong brine and commences to deposit salt, then it is turned into a third pond, where it remains until the water is all dried out and the salt is ready to be gathered up. The salt is then scraped together into convenient piles with wooden implements and shoveled into cars that are run upon movable plank tramways to some convenient point where it is put into gunny-sacks and carted to the warehouses to await shipment to San Francisco. This business of collecting salt has been followed here for some years, and it is increasing in importance every year. There were shipped to San Francisco something in the neighborhood of 6,000 tons from these salt fields last season, and there will probably be one-third more produced this year.

Mr. John Quigly, of Alameda, who owns quite extensive salt basins, informs us that this year, during the month of June, the drying weather was unusually advantageous to salt-making, and that the month of July was not so good as it gen-

erally is, owing to excess of moisture in the air.

The best months for evaporating are generally August and September. We would here suggest the propriety of some measures being taken by our Agricultural Institute to keep a record of the daily evaporation in these salt basins, to be noted in connection with effects on vegetable growth, &c.

The best crude sea salt is far from being pure. Pure salt is composed of sodium 39.3 and chlorine 60.7 to one hundred parts; while unrefined sea salt contains in addition, bromides, sulphates, silicates and carbonates of the bases—limes, potassa, magnesia, etc. The salt produced in Alameda County is remarkably free from sand, as the shores are marshy and the winds favorable. The price of salt by the ton averaged the producers about \$9.00 last year, ranging from \$7.50 to \$13.00. It is \$8.00 to \$9.00 this season at the landings.

NEW WORK BY KUSTEL.—"Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver." Under this title Dewey & Co., of the Scientific Press, San Francisco, will soon publish an excellent work by Guido Kustel. The reputation of the author renders unnecessary any further recommendation of the work, which, it is said, will be a clear and complete treatise on these subjects, which are of so much interest at the present time. Miners and others will find it of great value. The various methods and furnaces employed in roasting, and chlorination and lixiviation with the different manipulations and apparatus, will be fully described, and amply illustrated, together with remarks on the various advantages and disadvantages of each process, and their special application on this coast.

We would be glad to see fifty copies of this work in the hands of those having charge of and interested in mining operations in Alpine. Kustel is on the right track, as time will show.—*Alpine Miner, Silver Mountain, Cal.*

The above work contains 120 pages, and the price is \$2.50 coin or \$3 currency. For sale at his office.

It is a great thing for elderly persons to have their fading eyesight restored to its youthful perfection. This can be done by Muller, who is recognized as the optician of the Pacific coast. His Brazilian spectacles, properly fitted and adjusted, are superseding all others in use.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurates, Arseniurates, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the Scientific Press and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful reproductions of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for \$1.—*New Age.*

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

How Roots Grow and Feed.

The growth of roots occurs chiefly from a process of lengthening. Their increase in thickness is very slow, and the lengthening process is confined chiefly toward the outer extremity of the root. Take a young root of any annual, and mark it off into four equal lengths, and almost the entire increase will be made in the last or outermost division—and chiefly on the last inch from the tip.

But little or no nourishment is taken up by the main roots or even rootlets of plants; their sustenance being obtained, almost entirely, through the little hair-like appendages attached to the main roots, and which are known as root-hairs. The tips of roots, do not, as is generally supposed, collect food for the plant. The true service of this portion of the root is to push forward through the soil, and thus make room upon its constantly increasing surface, for the further outgrowth of these hair-like appendages, through which the plant is fed. In fact the extreme tips of the main roots cannot take up liquid at all. Their use, growth, and mode of work will be illustrated and explained in a future article. All other parts of the root, so long as they continue to present a delicate surface, are constantly throwing out these little feeders in search of food. These in deciduous trees, drop off every season about the time the leaves fall; and, like the leaves, are renewed the next spring. They are the mouths, as the leaves are the lungs of the plant. When roots

FIG. 2.

are grown in a rich soil they are usually short, thick and matted. In a barren soil they are long and attenuated—the feeders are usually more numerous, but at the same time more scattered, so as to be prepared to gather up nourishment from a larger area. If the nourishment is to be found near the surface, the roots go there after it; if at a considerable depth, the roots go down to where it is, if the nature of the soil is such as to allow them to penetrate. Thus the root system accommodates itself to its circumstances, by what seems to be almost a natural instinct. Indeed, this propensity in plant roots to always go directly to where their food chances to be has sometimes, and not inappropriately, been called vegetable instinct. We have already shown in past numbers that even such frail plants as our serials will sometimes go down to the depth of from five to seven feet. Of course perennials, which continue to increase year after year, grow to a much greater distance and depth. The total aggregate length of the roots of a plant is generally but little understood. Careful measurements have shown that, under some conditions, a vigorous barley plant will have an aggregate of 128 feet in length of roots, while oats have been known to reach an aggregate of 150 feet. The aggregate-length of roots depends very much upon the nature of the soil. In rich and porous ground a barley plant will generally produce about 130 feet in length of roots; but in a coarse, poor, or very compact soil a sim-

ilar plant will develop, even under otherwise favorable circumstances, not more than 80 feet of roots.

In drawing a plant from the earth, a small portion only of the roots is brought up, as the root-hairs are very frail. Fig. 1, represents a mustard plant just starting, which has been carefully taken up from the earth, and the dirt as carefully removed by the aid of water. It will be noticed that the entire root is thickly covered with hairs, except the tip, which was at the time rapidly pushing its way into the soil.

The root hairs are exceedingly delicate in their construction. They are not, as their name would import, a substance different from the surface out of which they grow, like hair upon animal bodies, but they are simply tubular and outgrowing elongations of the outer cells of the roots, through the walls of which the nourishment of the plant is taken up. Fig. 2 is a portion of a barley root highly magnified, showing the cells of the root and the manner in which the root-hairs grow out from them. As already stated, the nourishment of the plant is received through the walls of these little hairs or tubes, and it is then conveyed to the interior of the cells, whence it passes on and up to the leaves of the plant, where it is properly elaborated by contact with the atmosphere and distributed throughout the leaves, stems, trunks and fruit, to add to and build up all those parts of the plant.

There are a few plants which are destitute of root-hairs, among which may be mentioned, among the larger plants, the silver fir—*Abies pectinata*—and, among the smaller, the common onion. The rootlets or small roots (not the root-hairs) of all such plants are of an exceedingly delicate structure, soft and spongy—not corky—nearly or quite white, with a cuticle highly favorable to absorption. It is by reason of this peculiar and delicate structure that such roots are enabled to obtain their nourishment direct, without the intervention of root-hairs. We might almost as soon think of absorbing moisture from the ground through the walls of india rubber hose, as through the thick, hard walls of ordinary root growth.

We are indebted to Johnson's "How Crops Grow" for the original of the engravings and for most of the ideas given above.

DROUGHT AND MOISTURE.—We are told of a somewhat singular effect on certain vegetable growths produced by the hot weather of June, followed by the cooler days of July. Potatoes that were planted in Alameda County for an early crop were so checked by the dry, hot weather of June that the more favorable weather of July caused them to take a second growth, by which the crop is nearly ruined. In some cases beans were so blighted by the excessive dryness and heat of June that but little yield will be derived from them; in others the propitious weather of July has brought out a new bloom which promises a fair harvest.

GOOD FARMING.—A writer says: "Crops can be harvested at a time when they take little fertility from the soil. It is the ripening of grass which injures the hay and soil." This remark is true as applied to grasses. The formation and growth of seed abstract from the richness of the soil.

The formation and ripening of the seed is mainly at the expense of other portions of the plant, not the soil. The material for that formation has already been taken from the soil when the plant is in flower, so that it makes but little difference in the exhaustion of the land, whether the hay be cut in bloom or when fully ripened.

BUTTON ONIONS.—Mr. J. Ralph, of Alameda, on a strip of soil twenty-seven rods long by one rod wide, from 500 lbs. of onions set for seed, produced this year 1,000 lbs. of button or top sets. This is a very extraordinary yield.

Grain Markets, as affected by Seasons.

BY PROFESSOR ROWLANDSON.

It being now a pretty well accepted axiom, by the mercantile interest that the equilibrium of grain values, throughout the world, is mainly guided by the prices ruling in British Markets, and as the latter depends in a large measure on the climatic influences which may prevail in the British Isles at various seasons in each succeeding year, it becomes an interesting subject to Californians to be well acquainted with the character and times at which certain atmospheric influences are calculated to affect the cereal harvest of the British European Dominions. By being well posted on the respective influences of the climatic phenomena alluded to, the thinking California farmer will be enabled to judge, equally with the great grain operator, of the effect which may reasonably be anticipated upon permanent prices, on the occurrence of any great climatic change at certain critical seasons of the year. By knowing these facts, farmers would be less liable, in the sale of their wheat crop, to be misled by "canards" or what has sometimes in this State been equally injurious to their pecuniary interests, by being induced by well meaning, but mistaken friends, to hold their grain for high prices at times when the markets of San Francisco presented fair ones as compared with others throughout the world, and when no reasonable argument could be adduced to show that higher terms would be speedily attainable. The money lost by California farmers by unwisely holding, probably exceeds tenfold that which they have lost by hastily selling.

Extreme Prices during the past fifty-one years.

Greater variations have taken place in grain values in Great Britain during the past century than in any equal period of its history, and within that time the most remarkable changes have occurred within the last fifty four years, the most remarkable occurring in the years 1816 and 1835, in order that this may be more easily understood I have subjoined a short table.

Year	per quarter	per bushel	per cental	or per 100 lbs
1816	50 shillings	22s-6d	36s	\$9.00
1835	35 do	4s-4d	7s	1.50

Last year the average price of wheat in England was forty five shillings and three pence per quarter; on the 28th June the price was forty five shillings and two pence per quarter—the lowest for the season. *The latest telegraphic quotation of California wheat is 10s. and 10d. per cental or 6s. 10d per bushel, or 54 shillings and eight pence per quarter. It should be borne in mind always that the best California wheat on an average ranges twenty per cent above the average price of English wheat in English Markets. It may be here mentioned that the character of the year 1816 is vividly impressed on the writers memory on other accounts, from the mere fact that a sound wheaten loaf was not obtained oftener than once out of three purchases from the flour dealer; it is probable that such another dearth as respects wheat will never again take place in the British Isles. To explain however the external circumstances that would render such an event improbable though of considerable interest, would occupy too much space. In the celebrated potato famine year of Ireland, the best wheat obtained one hundred and thirty shillings a quarter or about seven cents per pound; this too was an extraordinarily exceptional year but can scarcely occur again in such an aggravated form; as free trade renders such a circumstance almost impossible.

Seed-time may be too wet or too dry.—Frost.

Some of the incidents which will be touched upon, at one period possessed a much greater influence on prices than they are now or are ever likely to do again, free trade and improved modes of culture having greatly ameliorated their mischievous tendency—These remarks specially apply to seed time, which during the protective system was watched almost as anxiously by speculators as the harvest. Seed time may be dry too or too wet, material injury from the former rarely occurs, unless it is very prolonged; and thus throw the seedling so late as to be affected by heavy rains; such a circumstance is however very rare, and usually only productive

of partial injury. Cases however have occurred where forward farmers who have sown their wheat at a dry period in September have had to re-sow, but such very early sowers are sparse indeed, in fact agricultural curiosities. If seedling can be accomplished during the two mid weeks of October the future crop will probably never be injured at seed time by a too prolonged drouth; at all events, I have never known an instance of such taking place—At a critical condition of stocks of grain, speculators may sometimes be induced to purchase in the expectation of a rise on account of an unfavorable seeding period; but it would be hardly prudent for a California farmer to place any great dependence for enhanced prices on a too dry British seed time; and unless markedly by severe, or followed by a too wet one, it will be much better for him in the majority of cases to sell on the first rumor of a rise on either account; in the latter case rumors of an adverse character usually become current from November to January; that is immediately after the season has so far progressed that all danger from over aridity has disappeared. A wet season may however continue with intervals of frost from November to March in which the latter sometimes plays an injurious part on light and black soil, owing to the freezing of the moisture raising the friable soil in consequence of ice expansion, which contracts on melting from the solar influence. In this way the plants become partially or wholly drawn out of the ground; as until May they are retained in place chiefly by their superficial roots. A succeeding night's frost will probably destroy them. Drainage and "the presser" the latter especially on light sands are sufficient preventives, this instrument might be found advantageous on the light soil of California.

—*Written within a few days after the preceding date.
[CONCLUDED NEXT WEEK.]

Flax Culture.

There are about 450 acres of flax now under cultivation in Alameda County, the most of which is grown in Amador Valley, not over ten acres of which will be utilized for fiber. The yield of seed, however, will undoubtedly be good. Mr. F. Malten, near Alvarado, has thirteen acres that will yield finely. He cultivates the Russian variety. It stands thirty inches high in the field. He will rot a part of his straw for the Oakland factory to experiment with.

Several farmers in Santa Mateo and Santa Cruz and one or two other counties are also cultivating flax to some extent. The seed, a market for which can always be had in this city, pays for the culture. Hitherto the Oakland factory has not been able to substitute flax fibre for jute in their bag manufacture, owing to the disinclination of farmers to properly prepare it. But, as stated above, Mr. Malten will this year so prepare a portion of his straw as to enable the factory to give the hemp fiber a proper trial with their machinery. Should the experiment succeed, a large market for the straw, as well as the seed, will be opened up, which will, no doubt, give a new impetus to the business. The demand for bagging, twine, etc., for this coast alone, if fully supplied here, would give employment to a dozen such mills as the one now in operation at Oakland and greatly enlarge the area of flax culture in the State. Flax culture in California is a settled fact, and the utilizing of the fiber is only a question of time.

A MODEL FARM.—Thos. G. Price, of Cottonwood, says the Marysville Appeal, has one of the best farms in the whole of Northern California. He has about 640 acres of land, about 500 of which are under cultivation, and his grain will turn out from 35 to 40 bushels to the acre. He has just finished heading. His barn has no superior north of Marysville, and is 64 by 80 feet, two stories high, and arranged in the most convenient manner, and all the improvements on the place are in keeping with it. Mr. Price is one of those farmers who follow farming as a business and not as a speculative enterprise, and his place reminds us of those that are to be seen in the older States.

OLD HAY.—Peter Shurtz, a farmer living in Clifton, N. Y., has in his barn hay that was cut fifty-four years ago. It is said to be as bright and sweet as any cut this summer.

Agricultural Editors' Meeting.

At the meeting last week of the Agricultural party at the Mechanics' Institute, to hear something concerning the resources of California, quite a large number of persons were present. General remarks were made by Mr. Hallidie, of the Mechanics' Institute, and Mr. Reade, of the excursionists. Ira P. Rankin gave a sketch of the iron interest. Prof. Carr made some interesting remarks on our agriculture and gave some reasons for the great fertility of the soil. The lumber interest was represented by Mr. S. Wetherbee, who said the number of mills on the Coast was forty; the number of men for each mill was averaged at 100; 40 ships, 30 brigs and 60 schooners are engaged in transporting this lumber and employ about 1,000 men, while some 2,000 men are employed in this city in handling the timber; the annual production is about 150,000,000 feet, worth some \$8,000,000. Mr. Shaw and Mr. Haskell spoke of our fruits. Mr. Harszthy said there were some 30,000,000 grape vines in the State; that Sonoma vineyards average 350 to 400 gallons of wine per acre, worth at the vineyard 25 to 35 cents. The average cost of getting land, setting out vines etc., he put at \$150 per acre, and the average yield at \$50 to \$90 net. The estimated production this year will be five to six million gallons. Mr. D. McLoon thinks the next wool clip will amount to some 20,000,000 pounds, worth \$4,000,000. Of this amount, about 4,000,000 lbs. would be worked in the California and Oregon mills, which employ 80 sets of machinery, worth \$660,000. Messrs. Phelps, Rowell, Dunn, and Clapp then had the floor, after which the guests were represented by Messrs. Lyman, Curtis, Quinn and Smith, who made interesting remarks. The company then adjourned to test samples of California wine and cake, which were provided in a neighboring room. Most of the party left for the East on Friday of last week.

CALIFORNIA FARMERS AND THE ENGLISH GRAIN MARKET.—In another column of to-day's issue, some observations by Prof. Rowlandson will be found, on the influences exercised by climatic agencies on the wheat markets of Great Britain; a careful study of which will enable the California farmer to judge, as well as the shipper, speculator or newspaper writer, as to the probable consequences which may result from any unusual climatic changes on the prices of wheat. The London and Liverpool markets are daily reported here by telegraph, and placed within the reach of all, accompanied with comments, when required, of the hearing which the weather may have upon present or future prices. Our wheat growers should read and study, in connection with the market reports, these observations, which will be continued through two or three numbers, to the end that they may become their own judges of when to sell, and not subject themselves to losses, occasioned by *canards*, set afloat by interested parties. Holding out flattering hopes of high prices to our grain producers on false ideas or baseless premises, has worked immense pecuniary injury to our farmers. There are also other matters than those pertaining to the weather, which have a greater or less bearing upon the British wheat market, which our correspondent will probably elucidate in future issues. With such information before them, there would seem to be but little need that our California wheat growers should be made the victims of false rumors, set up in the interest of unscrupulous speculators.

SICK HORSES.—When a horse refuses to eat, he should not be made to do any more service that day, for it may be known that he is tired or sick. It is barbarous to compel a horse to perform labor when in such a condition that he refuses grain; yet it is often done, and by men who think they are merciful.

Root Culture in Alameda County.

The town of Alvarado is situated near the mouth of the Alameda Creek, within reach of navigation from the Bay, and about six miles from the nearest station of the Western Pacific Railroad. The land in the immediate vicinity, and the soil is composed of a fine, rich alluvium, deposited by the overflows of Alameda Creek, upon the salt marshes. Below the town the marshes extend a long distance to the right and left. These marshes are used as pastures, and are also partly occupied for salt making.

Pelaloes.

The low, rich alluvial soils in this region are unsurpassed for productiveness, especially in dry seasons. On the ranch of Wm. Whidden, near the town, 20,000 bushels of potatoes have been produced on 100 acres.

Onions.

Mr. W. has also produced 600 bushels of onions upon one acre of land, at one crop, and has now, in one body, 20 acres of onions, which he will guarantee to average 500 bushels to the acre.

I have seen excellent onions growing on the low bottom lands, along rivers in the Sacramento Valley, where the soil has a fine deposit of alluvium. Also on the Rio Grande, in New Mexico, where irrigation by flooding is practiced. There the little level places are dyked with low embankments, and the water is run in, several inches deep at a time, and allowed to settle through the porous soil. The onions of the Rio Grande were the largest, on an average, that I ever saw. But those of Mr. Whidden's, will turn out a bigger yield, of a firmer and better keeping quality. Mr. Whidden's onion land keeps moist to the very surface through the driest weather.

Big Yields.

From one piece of land, a few acres in extent near his house, he last year cut three tons of hay to the acre, then plowed and planted to potatoes; which yielded him 200 bushels to the acre, the same season. This year he has harvested 90 bushels of barley to the acre, from the same land, and some laborers have found it profitable to dig the ground over for volunteer potatoes, that grew among the barley.—100 bushels of shelled corn to the acre is an average crop on this soil; of Carrots 30 tons and of sugar Beets 40 tons to the acre. Mr. Harvey, owning an adjoining ranch, assured me that he had grown fully 100 tons of mangel wurtel Beets on an acre.

Chicory.

It is close to town, that Mr. F. B. Granger has produced such immense crops of Chicory. On 40 acres of land, so planted, he has produced not less than 1,600 tons of Chicory in one season! so I am credibly informed.—This season he has about 20 acres cultivated to this plant. There is a two story building erected in Alvarado for cutting and drying the root for market. A machine much like a hay cutter, slices the roots, and large iron drying pans, with perforated bottoms, are filled with the sliced roots and exposed to a draft of heat from a huge furnace until dried. In this condition it is shipped in sacks to manufacturers of "puro ground coffee" to be finally paid for and drank by the million.

FRUIT TREES growing in this vicinity are literally loaded with fruit of great size and beauty.—Of course only the highest swells of land in this low region, are suited to all sorts of fruits. On the ranch of Mr. Whipple, a little above the low lands, there is a fine young orchard, and even grapes, that show a very prolific tendency, and some trees on quite low ground look finely.

The Beet Sugar Factory.

It is at Alvarado that the new Beet Sugar Factory is established.—This I have not overlooked, but shall devote a special article to it.—As beets delight in a fine, rich, moist, yet light soil, and also grow to a great degree of perfection where it is a little alkaline or salty, it may be readily inferred that the selection of this locality for the erection of such works, is a wise stroke of policy, alike creditable to the foresight of the energetic projectors, and in accordance with the best judgment of practical men.

Fine Stock.

At the risk of making this article long, I will here mention that on the well kept ranch of Wm. Whidden I saw some superior, choice bred milk stock. Also a fine and beautiful Stallion—Black prince—sired by "Young Belmont" a perfect pet, yet full of fire and spirit.

At Hall's Ranch there are also some fine horses. One well known and beautiful bay of light weight, yet powerful and fleet as the wind, is called Woodbury, sired by "Lexington" of Kentucky.

The Bay counties can boast of no fine imported stock as there is in the world, so impartial judges say, and surely it is beyond my power to conceive of anything that can exceed in fine points of beauty and excellence what I have seen in this section of the state.

S. H. HERNING.

What I Know of Farming—No. 30.

Roots—Turnips—Beets Carrots.

If there be any who still hold that this country must ultimately rival that magnificent Turnip culture which has so largely transformed the agricultural industry of England and Scotland, while signally and beneficently increasing its annual product, I judge that time will prove them mistaken. The striking diversity of climate between the opposite coast of the Atlantic forbids the realization of their hopes. The British Isles, with a considerable portion of the adjacent coast of Continental Europe, have a climate so modified by the Gulf stream and the ocean that their summers are usually moist and cool, their Autumns still more so, and their winters rarely so cold as to freeze the earth considerably; while our Summers and Autumns are comparatively hot and dry; our Winters in part intensely cold, so as to freeze the earth solid for a foot or more. Hence, every variety of turnip is exposed here in its tender stage to the ravages of every devouring insect; while the 1st of December often finds the soil of all but our Southern and Pacific States so frozen that cannon-wheels would hardly track it, and roots not previously dug must remain fast in the earth for weeks and often for months. Hence, the turnip can never grow so luxuriantly, nor be counted on with such certainty, here, as in Great Britain; nor can animals be fed on it in Winter, except at the heavy cost of pulling or digging, cutting off the tops and carefully housing in Autumn, and then eliciting and feeding out in Winter. It is manifest that turnips thus handled, however economically, cannot compete with hay and corn fodder in our Eastern and Middle States; nor with these and the cheaper species of grain in the West, as the daily winter food of cattle.

Still, I hold that our stock-growing farmers profitably may, and ultimately will, grow some turnips to be fed out to their growing and working animals. A good meal of turnips given twice a week, if not oftener, to these, will agreeably and usefully break the monotony of living exclusively on dry fodder, and will give a relish to their hay or oat stalks and straw, which cannot fail to tell upon their appetite, growth and thrift. Let our cattle-breeders begin with growing an acre or two each of Swedes per annum, so as to give their stock a good feed of them, sliced thin in an effective machine, at least once in each week, and I feel confident that they will continue to grow turnips, and will grow more and more of them throughout our future years.

The Beet seems to me better adapted to our climate, especially south of the fortieth degree of north latitude, than any variety of the Turnip with which I am acquainted, and destined, in the good time coming, when we shall have at least doubled the average depth of our soil, to very extensive cultivation among us. I am not regarding either of these roots with reference to use as human food, since our farmers generally understand that use at least as well as I do; nor will I here consider at length the use of the Beet in the production of Sugar. I value that use highly, believing that millions of the poorer classes throughout Europe have been enabled to enjoy Sugar through its manufacture from the Beet who would rarely or never have tasted that luxury in the absence of this manufacture. The people of Europe thus made familiar with sugar can hardly be fewer than 100,000,000 and the number is annually increasing. The cost of Sugar to these is considerably less in money, while immeasurably less in labor than it would or could have been had the tropical Cane been still regarded as the only plant available for the production of Sugar. But the West Indies, wherein the Cane

flourishes luxuriantly and renews itself perennially, lie at our doors. They look to us for most of their daily bread, and for many other necessities of life; while several, if not all of them, are manifestly destined, in the natural progress of events, to invoke the protection of our flag. I do not, therefore, feel confident that Beet Sugar now promises to become an important staple destined to take a high rank among the product of our national industry. With cheap labor, I believe it might to-day be manufactured with profit in the rich, deep valleys of California, and perhaps in those of Utah and Colorado as well. On the whole, however, I cannot deem the prospect encouraging for the American promoters of the manufacture of Beet Sugar.

But when we shall have deepened essentially the soil of our arable acres, fertilized it abundantly, and cured it by faithful cultivation of its vicious addiction to weed-growing, I believe we shall devote millions of those acres to the growth of Beets for cattle-food, and, having learned how to harvest as well as till them mainly by machinery, with little help from hand labor, we shall produce them with eminent profit and satisfaction to the grower. On soil fully two feet deep, thoroughly underdrained and amply fertilized, I believe we shall often produce one thousand bushels of Beets to the acre; and so much acceptable and valuable food for cattle can hardly be obtained from an acre in any other form.

So with regard to Carrots. I have never achieved eminent success in growing these nor Beet, mainly because the soil on which I attempted to grow them was not adapted to, or rather not yet in condition for, such culture. But should I live a few years longer, until my reclaimed swamp shall have become thoroughly sweetened and civilized, I mean to grow on some part thereof 1,000 bushels of carrots per acre, and a still larger product of Beets; and the Carrot, in my judgement, ought now to be extensively grown in the South and West, as well as in this section, for feeding to horses. I hold that 60 bushels of Carrots and 50 of Oats, fed in alternate meals, are of at least equal value as horse-feed with 100 bushels of Oats alone, while more easily grown in this climate. The Oat-crop makes heavy drafts upon the soil, while our hot Summers are not congenial to its thrift or perfection. Since we must grow Oats we must be content to import new seed every 10 or 15 years from Scotland, Norway, and other countries which have cooler, moister Summers than our own; for the Oat will inevitably degenerate under such suns as blazed through the latter half of our recent June. Believing that the Carrot may profitably replace at least half the Oats now grown in this country, I look forward with confidence to its more and more extensive cultivation.—Horace Greely.

Notices to Correspondents.

A. B. E. Walla Walla, W. T. There is a number of pans made in this city for the purpose of prospectors, and for assay sweepings and refuse. Thus, Hanscom & Co., make a Varney pan, 40 lb. charges, for \$100; the Miners' Foundry makes 12-inch, 18-inch and 32-inch pans of the Wheeler or Stewart pattern, for \$75, \$125 and \$300 respectively; Booth & Co. make 16 and 18-inch pans, for \$100 and \$125; the Golden State works make the Eureka pan, 25-inch, for \$110 etc. These will work charges of from 30 to 150 lbs.

W. F. A. San Jose. There have been electro-magnetic machines, innumerable patented and invented, but hitherto none have been economical successes. The latest and most promising is the electro-magnetic sewing machine, in which the power is applied directly to the needle arm, and which is, perhaps, the one you have in mind. The inventor of this is very sanguine as to the result. Should this be the one you refer to, you can undoubtedly get what information you desire by applying directly to Joshua Hendy, Union Foundry, corner of First and Mission Streets, S. F.

RECEIVED. Notes on Placer county, and a Trip over the Central Pacific Railroad.

The New York Silk Convention.

This convention of which mention has already been made, was held pursuant to announcement, on the 28th, ult. Twelve silk manufacturing firms were represented. Representations of the progress and present condition of the silk interest on this coast, were made by Mr. J. Neuman, of this city and Mr. J. Q. A. Warren. Specimens of California manufactured and reeled silk were exhibited; also California cocoons of different varieties, all of which were pronounced very superior by those present. The meeting was declared merely a preliminary one, though one of the utmost importance as involving the encouragement and opening up of a new trade which had fair to form a most important national industry.

The question to be considered was "What could be done by the manufacturers of the Atlantic states to encourage and further this new source of industry and national profit. Our people are paying millions of dollars to foreign countries for silk goods, which we might and ought to produce at home. Mr. Neuman said, that Lyons had become successful and opulent through her silk manufactures; because

she has monopolised the best cocoons. But no part of the world can produce better cocoons than California, from which our own manufacturers ought to derive their supply. California might herself become a successful rival of Lyons.

Mr. Skinner remarked, that there was no question about the quality of the silk which California produces; the only question was: "How much could she produce, and how fast could her production of raw silk be increased?"

Much interest was manifested by those present, in the object of the meeting, and before the meeting dispersed, a vote was formed requesting the chairman Mr. G. B. Skinner, to appoint a committee to arrange for a future meeting.

Since the above was put in type the telegraph has announced that the Convention will meet again in September; and that Mr. Neuman is now on his way to this State with orders, at fair prices for all the raw silk California can produce, which shall be equal to the samples that were shown at the late meeting of manufacturers.

The Approaching Horticultural and Agricultural Fairs.

THE FOMOLOGICAL AND HORTICULTURAL EXHIBITION, to be held in this city on the 29th inst, at the Pavilion of the Mechanics' Institute, promises to be a most successful affair. The list of premiums comprises a total of \$1,500—\$650 for fruit; \$500 for flowers and ornamental plants; \$150 for vegetables; \$150 cereals and \$50 for miscellaneous articles, including wool, silk, flax, etc. It is required that the cereals should be put up in bottles holding not less than three ounces of clean grain, or in little sheaves of not less than twenty heads each. Farmers having grain fit for seed may find the Fair an excellent place for drawing attention to it. Exhibits of large sheaves and of grain in sacks will be welcome. Besides the \$1,500, distributed into five funds as above stated, there is an additional sum of \$500 set apart for special premiums. Many farmers and orchardists have promised to contribute to the Fair, which it is expected will be a fine success. It will continue for five days, and it is hoped that the entire State will be represented at this exhibition.

THE STATE FAIR, will commence at Sacramento on the 12th of September and continue six days.

THE SAN JOAQUIN VALLEY FAIR, will commence at Stockton on the 4th, of October and continue five days. The managers of this fair have appointed a Committee, for the purpose of visiting the grain fields, to witness and report upon the operations of the various threshing machines, which may be entered for competition at the fair. An interesting and intelligent report may be expected from this Committee.

THE OTHER LOCAL FAIRS, in the State will be held as follows: The Stanislaus County Fair will commence on the 6th of September and continue four days; the San Mateo County Fair will commence on the 3d of October and hold six days. The Northern District Fair is to be held in Marysville; the Sonoma County Fair in Petaluma; the Butte County Fair in Chico and the Alameda County Fair in Hayward. We are not, at this present moment, advised of the days set for holding the four last mentioned Fairs.

IRON FROM THE ORE.—The iron for the Northern Pacific Railroad will be made from the ore and rolled for use, near its Eastern terminus, somewhere in the vicinity of the south western shore of Lake Superior. Competent parties are now looking around for the most convenient and economical location for the necessary furnaces and mills. The charter requires that the track should be laid exclusively with American iron.

The Clay Steam Cooker.

It may be of value to many of our readers to know of the ingenious contrivance for cooking by steam, a general view of which is given below. It is the invention of a Wisconsin man who has studied the subject carefully and presents this as the result of his labors.

A shallow sheet-metal box, H, the steam generator, is provided on top with any desired number of short tubes, for conducting the steam into the cooking-vessels, and a pipe, D, for introducing water into it. On top of this generator are placed the vessels, B, which contain the articles to be cooked. The bottoms of these vessels are provided with tubes which fit tightly upon the corresponding ones on the generator. Within the vessels, on a grating, are placed the utensils for holding the food, which are of different kinds adapted for the different varieties of food, and the several methods of cooking. They may be of wire gauze or perforated metal, to admit steam from all sides, or of the form of an ordinary pan or pail, open only at the top, or closed vessels for heating articles without subjecting them to the direct action of the steam, etc. Tea pots may be made to fit the tops of the vessels, B, as shown in the cut, thus allowing the tea to be thoroughly steeped, but not boiled, to attain which object many expensive devices have been invented.

In using the apparatus, the generator is partially filled with water, put on the stove and the required vessels placed on it so as to connect with the tubes spoken of above. Any tubes remaining are closed with the proper covers. The steam generated in H passes into the vessels, B, and there coming in contact with the food or the dishes containing it, quickly and thoroughly cooks it. As the steam condenses, it runs back into the generator. As the water boils away, it may be replenished from the hot water can, C, on top of one of the vessels, B.

By using the apparatus and placing the different articles in separate and isolated vessels, the cooking can be done and the flavor of each article retained without impregnating others, which too commonly happens, as when the various articles are placed in a common vessel or in communicating vessels. A patent has been granted for the device to J. O. Clay of Hudson, Wisconsin, whose agents on this coast are Wiester & Co. 314 Bush Street, San Francisco, to whom apply for further information.

AUGUSTUS MILLER, an old hunter, found a portion of the remains of some huge animal in the bank of Dry Creek, Stanislaus county, last June. These he is now exhibiting at Platt's Hall in this city. The fossils are said to come from a stratum of hard cement and lava, 37 feet below the surface.

NINETEENTH ANNUAL COMMENCEMENT AT SANTA CLARA COLLEGE.—The account of the commencement exercises, sent us by our representative on this occasion, comes too late for this week's issue. We shall notice it in our next.

LATEST telegraphic dispatch, good for any date. A battle momentarily expected!

Agricultural Notes.

THE CALIFORNIA PACIFIC RAILROAD is doing an immense business in freighting wheat. All along the line of the road immense piles may be seen waiting for transportation. Thousands of tons, quantities far exceeding the capacity of the road to move in a day or a week, are constantly in readiness. Notwithstanding some 600 tons of grain, principally wheat, arrive daily at Vallejo, there is no diminution, but rather an increase, in the constantly accumulating piles. Several months must elapse, before the last sacks will find their way to shipping.

Large quantities of grain are now being brought down from the regions of Stockton and beyond by the Central Pacific Railroad. The wheat which is transported over this route is shipped direct from the railroad terminus at Oakland. Conveniences for weighing and loading have been provided by the company. Last year the expenses of transporting wheat from Paradise Valley to this city were \$9 per ton. This year all goes to Oakland at a cost of only \$4.95, or a clear saving of over \$4 per ton! The loss from handling, etc., has also been reduced from a very considerable figure to a mere item.

CHAMPION WHEAT.—A stool of wheat, raised at Sherman Island, has been on exhibition at the Mercantile Library the last week, where 250 separate stems and heads are shown to have grown from a single seed of the Sonoma Club wheat. Can any other country in the world show the like?

RESULTS OF IMPROVED CULTIVATION.—Mr. Mothershed, near Salinas, has 100 acres of wheat, which will yield 60 bushels to the acre. He attributes this large yield to deep plowing. Almost everywhere throughout the State, where deep plowing and thorough cultivation, and especially fallowing, have been resorted to, greatly improved results have been realized—much more than to merely meet the increased expense.

GOOD WORK.—Messrs. Shurtz & Simpson, on Money's ranch, near Tehama, recently threshed 2,679 bushels of wheat in one day; 3,000 bushels would have been threshed, if there had been a full set of hands.

COTSWOLDS.—W. F. Wilson of Ohio, has gone to England to purchase Cotswold sheep for Oregon.

NEW OIL MILL.—John Briggs, who has harvested 125 acres of castor beans, near Marysville, is about to erect an oil mill to work his product, rather than sell the same at 4½ cents per pound. It is said that 800 acres have been planted with castor beans in Yuba and Sutter counties this season.

A FRENCH COLONY has recently located on some government land near San Antonio, Monterey County, with the intention of cultivating grapes.

BAMBOO PLANTS.—Japanese bamboo plants are growing finely on Twitchell Island and at Calistoga. The Alta says there are now 4,000 of these plants in the State, all doing finely.

HOPS.—Seventeen acres of hops are growing and doing well upon the Blanchard farm, on the Honeycut creek, for which the proprietor expects to realize from \$7,000 to \$8,000.

DOES FARMING PAY?—An Irishman, name not given, according to the Sutter County Banner, has raised, this year, wheat to double the amount which he paid two years ago for his ranch, situated in Bear Valley. The crops, generally, in that locality have done well this season.

THE TEXAS CATTLE TRADE.—Two hundred thousand head of cattle will go from the counties of Northern Texas this year. Northern Texas has exported, during the season, produce to the value of \$40,000,000.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING AUGUST 2d.

STOCKING—Ferdinand Woodward, Sacramento, Cal.

POTATO-DIGGER—Uriah R. Harlow, Farmersville, Cal.

SPRING FOR BEDS, SOFAS, &c.—William Lord, San Francisco, Cal.

BALLING-PRESS—George W. Nutter, Santa Cruz, Cal., assignor to himself and Charles Keeton.

WATER-CLOSET RECEIVER—William Smith, San Francisco Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

SPADES AND SHOVELS.—J. W. Pearce, Suisun, Cal. In constructing shovels, it has been customary to form the blade and one strap of the same piece of metal, and to rivet the other strap on the blade, the handle being inserted between the two straps and there secured by rivets. Ordinarily the angle, or corner, where the straps join the blade, is made in the shape of a right angle, and the straps are apt to break off at this point. To remedy this defect and to secure the handle more firmly in place, the straps, in the improved method, have rounded corners at their junction with the blade, and instead of rivets, ferrules or bands are employed. At the upper end of the straps an ordinary metallic band may be used, but at the lower end, owing to the form of the straps and handle, such a band cannot be used. Here stout wire is wound tightly and soldered together and to the straps, forming a very strong and durable fastening.

GANG PLOW.—E. W. Walton, San Leandro, Cal. The novelty of this invention consists principally in the device for raising and lowering the plow-frame. This is very neat and ingenious, and obviates several difficulties which have been found hitherto. The plow-frame rests with its front end on a bar, which has its end bent upward and adjustable, by an appropriate arrangement, in vertical standards attached to the axles of the wheels. On each side of the pole, directly in front of the bar, are fixed two metal plates, each with an angular slot, into which fits the projecting pin of a metal plate secured to each of the timbers of the plow-frame. Underneath these timbers, and secured to the bar, are two cams whose two arms pass up on each side of the pole, inside of the timbers mentioned. On the upper end of these arms are attached rods, extending forward between the plates on the pole, and loosely attached to the arm of the shaft, which turns in the upper end of the plates, and is operated by the hand-lever or sweep. These and the other arrangements render it easy to plow deep or shallow, on even or uneven ground, etc., as desired, and the whole seems to be a most desirable machine.

WEED CUTTER.—E. W. Walton, San Leandro, Cal. This is an improved machine for cultivating the surface of the ground by cutting down the weeds and leaving them exposed to the sun, so that they cannot sprout again and grow. A horizontal beam, similar to the ordinary plow beam, has at one end two handles (pivoted and arranged with a rod and clasp so that they can be shifted from side to side as desired), and a hollow vertical standard. To the lower end of this standard is attached a shovel by means of a rod passing through the shovel, standard, and beam, and secured above by a nut. The shovel or cutter is a triangular plate of metal, its front corner having a pointed piece of metal attached, and the two side corners being bent up. This plate slopes towards the front, so that the projecting point serves as a share to break the ground in front of the cutter, and the side corners throw up a narrow line of earth. This shovel is intended to cut but a slight depth below the ground, and thus cut and root up the weeds, which will be destroyed on being exposed to the sun. The clevis secured to the front end of the plow-beam in the usual manner,

consists of a vertical rack-bar provided with a number of teeth, between any two of which the link is placed. A long screw or bolt, passing down through a hole in the upper arm of the rack bar and secured below, stands directly in front of the teeth, and thus keeps the link securely in place.

FAUCET.—J. H. Lord, S. F. The rear end of a common faucet is provided with screw threads, on which work a nut, a metallic and an elastic washer. On the extremity of the faucet is screwed a short conical, hollow anger, whose greatest diameter is somewhat larger than that of the rear of the faucet, and which has small holes made through it between the threads, so as to allow the liquid to pass into it and

the period for which they shall hold their appointments, to acquire or take, directly or indirectly, except by inheritance or bequest, any right or interest in any patent issued by said office.

SEC. 17. And be it further enacted, That for gross misconduct the Commissioner may refuse to recognize any person as a patent agent, either generally, or in any particular case; but the reasons for such refusal shall be duly recorded, and be subject to the approval of the Secretary of the Interior.

SEC. 18. And be it further enacted, That the Commissioner may require all papers filed in the Patent Office, if not correctly, legibly, and clearly written, to be printed, at the cost of the party filing them.

SEC. 19. And be it further enacted, That the Commissioner, subject to the approval of the Secretary of the Interior, may from time to time establish rules and regulations, not inconsistent with law, for the conduct of proceedings in the Patent Office.

SEC. 20. And be it further enacted, That the Commissioner may print or cause to be printed, copies of the specifications of all letters-patent, and of the drawings of the same, and copies of the claims of current issues and copies of such laws, decisions, rules, regulations, and cir-

Louis Napoleon's Famous Mitrailleuse.

thence into the faucet. Now to use this, one needs only to bore into a can until the auger is through, then to turn this back a little until the face or ends of the threads bear against the metal between the slits made by them on entering, and then to force the washers up close to the metal on the outside. The device is most simple effective and convenient.

CANDLESTICK.—H. Zahn, S. F. This is an improvement on a former device for holding securely a candle in a candlestick. It consists in constructing the nut, through which the holding screw passes, so that it can be removed from one candlestick and attached to another as desired, and it renders easy the application of the device to porcelain, glass and other fragile candlesticks. It is a simple invention with regard to one of the most common of household utensils.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

[CONTINUED FROM PAGE 97.]

SEC. 12. And be it further enacted, That the Commissioner shall cause a seal to be provided for said office, with such device as the President may approve, with which all records or papers issued from said office, to be used in evidences, shall be authorized.

SEC. 13. And be it further enacted, That the Commissioner shall cause to be classified and arranged in suitable cases, in the rooms and galleries provided for that purpose, the models, specimens of composition, fabrics manufactures, work of art, and designs, which have been, or shall be deposited in said office; and said rooms and galleries shall be kept open during suitable hours for public inspection.

SEC. 14. And be it further enacted, That the Commissioner may restore to the respective applicants, such of the models belonging to rejected applications as he shall not think necessary to be preserved, or he may sell or otherwise dispose of them, after the application has been finally rejected for one year, paying the proceeds into the treasury as other patent moneys are directed to be paid.

SEC. 15. And be it further enacted, That there shall be purchased for the use of said office, a library of such scientific works and periodicals, both foreign and American, as may aid the officers in the discharge of their duties, not exceeding the amount annually appropriated by Congress for the purpose.

SEC. 16. And be it further enacted, That all officers and employees of the Patent Office shall be incapable, during

the period for which they shall hold their appointments, to acquire or take, directly or indirectly, except by inheritance or bequest, any right or interest in any patent issued by said office.

SEC. 21. And be it further enacted, That all patents shall be issued in the name of the United States of America, under the seal of the Patent Office, and shall be signed by the Secretary of the Interior, and countersigned by the Commissioner, and they shall be recorded, together with the specifications, in said office, in books to be kept for that purpose.

SEC. 22. And be it further enacted, That every patent shall contain a short title or description of the invention or discovery, correctly indicating its nature and design, and a grant to the patentee, his heirs or assigns, for the term of seventeen years, or the exclusive right to make, use, and vend the said invention or discovery throughout the United States, and the Territories thereof, referring to the specifications for the particulars thereof; and a copy of said specifications and of the drawings shall be annexed to the patent, and be a part thereof.

SEC. 23. And be it further enacted, That every patent shall date as of a day not later than six months from the time at which it was passed and allowed, and notice thereof was sent to the applicant or his agent, and if the final fee shall not be paid within that period, the patent shall be withheld.

SEC. 24. And be it further enacted, That any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new or useful improvement thereof, not known or used by others in this country, and not patented, or described in any printed publication in this or any foreign country before his invention or discovery thereof, and not in public use, or on sale, for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fee required by law, and other proceedings had, obtain a patent therefor.

[TO BE CONTINUED.]

THE BORAX COMPANY.—The Lower Lake Bulletin learns that the California Borax Company are about resuming operations after an inactivity of two years or more. The Borax Lake is quite low owing to the evaporation induced by the extreme heat this summer.

EARTHQUAKE AGAIN.—We are glad to learn that on Tuesday evening we had an earthquake shock in this city. We thought we were losing our good reputation in this respect. We shouldn't have found out this shock, however, of ourselves.

EARTHQUAKE.—At Santa Cruz, early on the morning of the 4th inst., there was a slight earthquake shock.

The Mitrailleuse.

The mention of this weapon being very frequently made in the war dispatches of the day, we think it will be of interest to our readers to know what sort of a thing it is. We accordingly give a cut and a short description of the gun, taken from *La Propagation Industrielle*.

The standard is shown clearly enough in the cut, it being remembered that, as this is a section, only two of the four legs are given. In a socket, at the upward-curved rear end of this frame, fits the stem of a revolving atel cylinder. This has four sets of chambers for the cartridges. Each set consists of five chambers, corresponding to the five barrels of the gun. These chambers when brought in succession to the lower part of the bores of the barrel, and when at the top, are in line with the surface of a loading table, which has grooves in it, so that the cartridge may be easily pushed into the chambers. One of the figures in the cut is represented as loading an upper chamber in this manner.

The barrels, situated in a horizontal plane, are five in number, and are not parallel but a little further apart at the muzzle than at the breech. The object of this is to give a scattering fire. There is a system of mechanism, indicated in the cut, but which we have not the space to explain in detail, by which the barrels may be adjusted in any desired plane, or placed at different angles with each other, within certain limits. The change of angle is for the purpose of enabling the gunners to sweep a wider or narrower area. When the chambers are brought into line with the barrels, a series of needles or strikers are driven into the rear of the chambers and against the fulminate of the cartridges, thus discharging the piece, by means of a bar (shown below the rear of the barrel,) which works automatically.

When it is desired to transport the gun from one place to another, the four legs of the support are brought into a horizontal position, parallel with the barrels, and two men can then carry the apparatus with ease. Hence it can be transported whither would be impossible to take a wheeled carriage.

The special advantages claimed for the mitrailleuse are its ease of loading and firing and transportation, its power of throwing continuous volleys in divergent directions, and the facility of varying the direction of the line of fire. In the method of loading, however, other devices seem to be its superior if in no other respect.

PULVERIZING FUEL.—The principle of pulverization of fuel for making steam has been introduced into a manufactory at Lewiston, Maine. The coal is placed in a hopper, from whence it comes through a mill in which it is ground to a fine dust, which is carried by a blower into the furnace. The latter is regulated to carry air enough to produce full and perfect combustion. The coal dust, thus introduced into the furnace, leaps into flame like grains of powder. It is claimed that this device saves thirty-three per cent of the cost, while steam can be generated in one-half the time required by the ordinary use of fuel. It is somewhat singular that, in the face of the unanimous and cumulative testimony in favor of the economy of the pulverization of coal for steam fuel, so little progress has been made toward its introduction into general use.

We are finally to have an Australian steamship line, with ample subsidy. William Webb will get the subsidy and run the line. Good!

Admiral Winslow, the hero in the Karsarge Alabama fight, has arrived in this city.

Professional Cards.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connois-
surs to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have
been forged, L. and P. give notice that they have
furnished their correspondents with power of attorney to take
instant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crose and Blackwell, London, &c. &c., and by
Grocers and Oilmen universally. Agents, CROSS &
CO., San Francisco. 1v20-3yew

A PROVIDENTIAL REMEDY. The Mongoose, bitten by
a poisonous serpent, seeks a certain plant, eats of it,
and recovers. In like manner thousands of European
dyspeptics, and victims of liver complaint, disorders of
the bowels, debility, dropsy, rheumatism, &c., flock to
the Seltzer Springs in Germany and are cured by its sa-
lubrious waters. We have this Spring, in all its sani-
tary perfection, multiplied ad infinitum, in this country,
in the form of TARRANT'S EFFERVESCENT SELTZER AP-
ERIENT. It is the Spa made portable and available for
the uses of the million. The million use it. It is the
great household medicine of the land, and at once de-
licious, refreshing, and unexcelled as a corrective and
alterative.

SOLD BY ALL DRUGGISTS.

ENCOURAGING REMARKS.—One of our readers writes:
"Incorporating an agricultural department into your
paper has made it acceptable and really useful all over
the country west of the Rocky Mountains, and prob-
ably further; and for my part I do not see how an intel-
ligent farmer, miner or mechanic can do without it."

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

70% SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the best BLASTING powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 20, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PER- SPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweet- ened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs; FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread; FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence, FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL
OF
MOUNTAIN BALM
—AND—
OREGON GRAPE,
Two Plants, abounding on the base of, and on the
Mountains surrounding
MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPA-
RATIONS OF SARSAPARILLA, richer in
quality and more efficient as a RESTORER OF
GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH,
is superior to other COUGH MEDICINES, by
bringing BOTH to bear with the stimulated action
of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above
asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS
for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a
dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should
be sent by Wells, Fargo & Co's Express to that office which is nearest to the invalid's residence, and that person
will be sure to get it.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast
corner of Sacramento and Montgomery streets, San
Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give
notice that they will be prepared to receive at their
office, on or before the FIRST DAY OF NOVEMBER
NEXT, designs and plans for the new City Hall of San
Francisco.

The Commissioners, in order to obtain the very best
design and plan, invite the fullest competition among
architects, and to this end have resolved to offer the fol-
lowing premiums:

First—For the design and plan selected and
adopted.....\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the de-
signs and plans, the Commissioners have prepared a
pamphlet containing full instructions and suggestions,
as well as the terms and conditions upon which the pre-
miums will be awarded.

Pamphlets can be had on application at the office of
the Commissioners.

Any design or plan in which the requirements of the
Board, as set forth in the printed instructions, have not
been reasonably complied with, will be rejected from
the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

Reading for the Hour.

The War.

If we have spoken but little on this subject, it is because we have been thinking so deeply, without being able to get out a plan for the campaign, which would satisfy ourselves as well as is desirable for such a paper as ours. Moreover, to get out a good plan, it was necessary to have one party whip, and we have held the powers to be so nearly equal, that we could not decide which one we should select as the victorious party, without danger of having our choice disproved before our paper reached the subscribers.

It is definitely ascertained, however, that the Prussians have gained decided advantage in this first encounter. They are the victors of the first battle, and the result is most dangerous for Napoleon. Should he suffer another defeat, the likelihood that France would obtain another ruler would be very great. But he is not entirely overcome as yet, and the fate of France depends not on a single battle.

The Prussians have done well so far and may do better yet. The French have been out-generaled and whipped, but may retrieve their losses. If we know which of the two cases are to occur, we shall keep it to ourselves until the next issue. Meanwhile we present our readers with some facts and descriptions of the arms used on both sides.

AN HONORABLE RECORD.—The New York *Tribune* says that A. A. Sargent, of California, representative at Washington, is without question the most industrious man in Congress. He has been absent only four days during the last session, and has introduced thirty-four bills, only two of which were of a private character. This is certainly a most honorable as well as deserved tribute, and one of which any man may well be proud. Mr. Sargent more especially than any other man, represents the Mining interests of the Pacific Coast, and aside from his untiring industry has also labored most "effectively" for his constituents; no one has done more to secure needed legislation for this Pacific States, nor less to farther personal or local schemes. His efforts will be appreciated by his constituents. The record which Mr. Sargent has made in Congress is none other than might have been expected from the habits of industry and devotion to principle manifested in his youth and early manhood. A California acquaintance of 20 years standing enables us to speak understandingly in this connection.

SAVE THE BONES.—Every farmer should provide a barrel or box for receiving chicken bones, fish bones, and bits of beef bones which accumulate in the kitchen. A hundred pounds may be saved in a few weeks. Such bones are more valuable for burying around all kinds of fruit trees and grape vines, than Peruvian guano, which is worth from three to five cents per pound.

SOFT WATER FOR HORSES.—Youatt, in his book entitled "The Horse," says this animal will never drink hard water if soft water is in reach; that he will leave transparent hard water for a pool of soft, even though the latter be discolored with mud. Very cold water from the well will make the hair rise up and not unfrequently cause an attack of the gripes. Give soft water, if practicable, especially if the animal is ailing.

A BIG NUOGET was found a couple of months ago at Berlin, in Victoria, Australia. According to the *Alta's* correspondent, its weight was 93 lb. 5 oz. 15 dwts.; length, 12 inches; height at highest solid part, 6 inches; at lowest, 4 inches; circumference of center, 16 1/4 inches; circumference of small end, 13 inches; or large end, 19 inches; circumference lengthwise, taken by the sides, 32 3/4 inches; by the top and bottom, 28 inches.

The World of the Ancients.

The ancient Hebrews seem to have had but little if any theory as to the shape of the globe, and the idea common to un-instructed people, that the earth is a flat surface, seems to prevail through the Bible. Among the Greeks, Homer was the first who has given us a written trace of a theory. According to this writer, the world was a flat disk, the River Ocean sur-

rounding the land on all sides. Beneath the earth were the regions of Elysium and Tartarus, above was the arch of the heavens, resting on the tops of the highest mountains. Fig. 2 will give a general idea

FIG. 2.—THE WORLD OF ANAXIMANDER.

of his geography. The Cimmerians dwelt in perpetual darkness and near the entrances to the infernal regions. Colchos, on the Black sea, was an ocean city whence the sun arose in the morning. Beyond the Rhiphaean mountains, on the north, dwelt a people who were exempt from all troubles and ills. The Ethiopians and the Pygmies, who fought pitched battles with the cranes, dwelt on the southern border of the earth. Towards the centre of Africa were the high peaks of the Atlas mountains on which rested the heavens. Many peoples and nations were given locations and fabulous characteristics which they long continued to hold in ancient geography.

Anaximander, four hundred years after Homer, held that the earth was of the form of a cylinder with the upper surface convex, and with its diameter three times as great as its height. The center of the system was Delphi, where was the noted oracle of Apollo. Fig. 1 gives the idea of the earth of this author.

Somewhat later, the idea that the earth was spherical, was propounded by Thales, one of the seven sages, who declared moreover that it was suspended in mid-air. The theory was not popular. Herodotus, who traveled extensively, added much to the geographical knowledge of the world, although he ridiculed the theory of its being a sphere. Socrates, four hundred years before Christ, asserted the globe-form of the earth, sustained in the middle of the heavens. Eratosthenes, a Cyrene Greek, reduced geography to a system. The spherical form of the earth was now generally considered to be the correct theory. Eratosthenes, proceeding on this principle, adjusted to it the known features of the globe. The great ocean still surrounded the land, but the known part of the world,

he became convinced, was only about a third of the whole. He supposed the rest to be a huge mass of water which he called the Atlantic, from Mount Atlas, which was fancifully believed to support the globe. This theory may be dated at about the year 230 B. C.

New Books.

MATERNITY. A Popular Treatise for Young Wives and Mothers. By T. S. Verdi, A. M., M. D., of Washington, D. C. New York: J. B. Ford & Co., Publishers. 8vo; pp. 451. Sold by A. Roman & Co., S. F.

The author of this work is a physician of the Homeopathic School, in Washington, where he has this reputation, we are told, of being an unusually successful practitioner. Judging from his preface, he appears to be one of the liberal class—one who, holding firmly to his own principles of homeopathy, is still willing to learn from those of diverse opinion. His book deals with delicate subjects, but such as are of great importance, such as young wives and mothers are or ought to be consulting their physicians about. There is a growing desire on the part of the public to know more concerning such subjects, and as the desire is healthy and the topic most important, we are glad to see such books as this, which appears to be very good. The subjects here considered are, in brief: Pregnancy, its symptoms, its disorders and their relief; Labor, and its necessities and helps; Infants, and the daily care of them from the very moment of birth; Children's diseases, their prevention and detailed medical treatment; Accidents; Poisons and their antidotes; Medicines, their preparation and administration; the Physical and Moral Training of Boys and Girls; Marriage; General Suggestions to Parents.

THE MEN WHO ADVERTISE. AMERICAN NEWSPAPER RATE BOOK AND DIRECTORY. New York: G. P. Rowell & Co., Publishers. 1870. 8vo; pp. 872.

No better proof is needed of the fact that advertising has become an art than this book, which contains a complete list of all the newspapers and periodicals published in the United States, Canada and the British Colonies of North America; the cost of advertising in most of the principal papers of the country; and a large amount of agreeable matter concerning those who are prominent as advertisers. In the way of advertising, this is the biggest and most original thing which we have seen.

THE PIUTE COMPANY OF CALIFORNIA AND NEVADA. San Francisco. 1870.

This is a handsome pamphlet, containing a large number of maps and engravings, and giving information with regard to the mining company whose name it bears. The original drawings were made by Mr. F. Wymper. It makes a very neat looking book.

THE AMERICAN COLLEGES AND THE AMERICAN PUBLIC. By Noah Porter, D. D., Professor in Yale College. New Haven, Conn.: Charles C. Chatfield & Co. 1870. 12mo; pp. 285. For sale by A. Roman & Co., S. F.

The question of what ought to be taught and what not taught in our American colleges has occupied of late a considerable share of public attention. The system which has hitherto prevailed of giving prominence to the classical studies, has been called in question, and "practical" courses have been demanded. Some of the colleges have made changes in their curricula to agree with these ideas. Similar changes have been made before, as at Amherst in 1826; at Harvard in 1825 and again in 1841; at the University of Vermont in 1829; at Brown in 1850; but after various trials, the several colleges have returned to their former systems. A new trial is now being made and its results are being awaited with interest. The present volume appears very opportunely and is of importance for our State with its young university. It is an able discussion of the matter, and argues in favor of retaining the classical studies—the ancient languages—with modifications of the common methods; and it also treats of topics akin to the direct subject. It deserves a large circle of readers.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MARAVILLA COCOA. For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5720-17

DR. HARTMANN, Physician, Oculist and Medical Electrician, cures all diseases of the eye, such as Granulated Eye Lids, Inflammation of the Eye, Opacities of the cornea cured permanently. Also, Paralysis, Rheumatism and all Nervous and Chronic Diseases, and all Female Complaints. 128 Kearny street. 25-250.

JAS. A. SULLIVAN, of Calaveras county, is requested to call at this office, or address us, on business. *

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENTON, GARR & CO. 2721-3m

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries at 10 to 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10118 6m B. F. HOWLAND.

BOILER FELTING saves twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1v21-3m

BLOK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 4v14-3m

NEVERMORE.—Can the coarse, gritty tooth powders and the tooth-destroying chemical fluids find a place on the toilets of sensible people? The fragrant and preservative Sozonox has superseded them all.

"SPALDING'S GLEK" mends Furniture, Toys, Crockery, all ornamental work.

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

Card

From the National (Elgin) Watch Co.

The attention of Watch-buyers is called to the following improvements in the American Watches, manufactured by the National (Elgin) Watch Company of Elgin, Ill.:

The ELGIN WATCHES are furnished with Burt's patent pinion, to prevent damage to the train in case of the breaking of the main spring.

The ELGIN WATCHES are furnished with a patent hair spring stud, to prevent the changing the adjustment of the hair spring after the watch has been regulated.

The ELGIN WATCHES are furnished with a patented contrivance for the letting down of the main spring without removing the dial or hands.

The ELGIN WATCHES are so constructed that the barrel can be removed and the main spring changed without taking the watch down.

The ELGIN WATCHES are furnished with the only complete protection against dust yet introduced upon American-made movements. The dust-excluder used upon the Elgin movements effectually encloses the works, and renders the entrance of dust an impossibility.

These improvements are peculiar to the ELGIN WATCHES, and are found on none others. The dust-excluder will especially commend itself to miners, railroad men, and others engaged in out-of-door employment.

The ELGIN WATCH branded "B. W. Raymond" is constructed with especial reference to its use upon engines and moving trains, and the Company claim for it that it is the best railroad watch in the world. The following prominent railroad officials have given it their hearty endorsement and commendation: E. B. Phillips, Esq., President Lake Shore and Michigan Southern R. R.; Col. C. G. Hammond, Superintendent Union Pacific R. R.; Edward H. Williams, General Superintendent Pennsylvania R. R. Co.; L. D. Rucker, General Superintendent Erie R. R.; J. M. Toucey, General Superintendent Hudson River R. R.; G. L. Dunlap, General Superintendent Chicago and North-Western R'y, and many others.

Ladies desirous of purchasing a handsome, strong, and correct time piece will find the elegant Watch bearing the trade mark of "LADY ELGIN" to be all that they desire. Inquire of your jeweler for the LADY ELGIN.

The real ELGIN WATCHES, elegant accurate, durable in many styles and at various prices, each accompanied by the special warranty certificate of this Company, and usually also guaranteed by the local dealer or watchmaker, can be had of most jewelers in all towns throughout the United States. Call and ask to see them. As an additional protection, look for "National Watch Co." on the dial, and one of the following TRADE MARKS, viz., "B. W. Raymond," "H. Z. Culver," "H. H. Taylor," "G. M. Wheeler," "W. H. Ferry," "Matt. Laflin," "J. T. Ryerson," "Lady Elgin," or "Frances Ruby," together with the words "ELGIN, ILL." engraved upon the gilt plate inside. These are the trade marks to denote the various grades and styles, but as even these have been pirated, require also the special warranty certificate, duly signed by T. M. Avery, the President of the Company, and numbered to correspond with the watch.

The trade on the Pacific Coast supplied at factory prices by Levison Bros., 629 Washington Street, San Francisco, who have on hand at all times a full supply of all grades of movements, and material for repairing the same.

An illustrated pamphlet, entitled "Making Watches by Machinery," by the late Albert D. Richardson, will be forwarded free of charge by sending address to

NATIONAL WATCH COMPANY,
159 and 161 Lake Street, Chicago;
No. 1 Maiden Lane, New York;
Or LEVISON BROS.,
629 Washington Street, San Francisco, Cal.

Pushing Forward.

It is hardly necessary in commencing a new volume, as we do to-day, to remind our readers that we are constantly pushing forward in our efforts to improve the SCIENTIFIC PRESS. We have never relied upon promises of what we propose to do; but have always been able to point to what we have done in the past, as the best assurance of what is in store for the future.

At the opening of the present year we reduced the price of the paper from \$5 to \$4 per annum, believing that the modified condition of affairs on the Pacific slope, growing out of the opening of the Overland Railroad, and other facilities for more frequent intercourse with other portion of the world, fully warranted such a step. Our anticipations have been more than realized in the increase of subscriptions, so much so as to enable us to give an additional amount of reading matter by the presentation to our readers of a double-sheet the first issue of every month.

Illustrations.

We have also made such arrangements as are now enabling us to greatly increase the number, interest and variety of our illustrations. While this improved feature adds largely to the cost of publication, we feel confident the additional interest and value thereby given to our columns, will be duly appreciated by a discerning public.

The Miner, the Mechanic, the Inventor, the Farmer and the Naturalist, will all find something of constant and practical interest in this direction.

The Miner will always be presented with everything new in the way of reducing ores, whether by mill process or by smelting.

All important improvements in Machinery will be promptly presented to the Mechanic, while the Inventor will be as regularly furnished with hints and stepping stones upon which others have mounted, and from which he in turn will be able to see still further and more clearly into the undiscovered future.

The ideas and instructions that we are here, constantly placing before the Farmer will speak for themselves. If the reader will pardon us for a mere hint at the future, we venture the promise that no one thing that is new and of any real practical importance in the mechanics of Agriculture shall be omitted in that portion of our illustrative department.

The Naturalist too will now add their find something to interest and instruct; while the general reader is never forgotten.

How far we have succeeded in making the SCIENTIFIC PRESS acceptable to the public, we can only judge by the words of hearty commendation which we are constantly receiving, not only from our brethren of the press, but from numerous private letters, from the readiness with which our patrons pay up their annual subscription and from the rapid increase in the list of subscribers.

A reference to the index published in our last issue affords the best evidence of the wide field of research and instruction in which we are engaged. The present number affords ample evidence of the truth of what we have written, and to strangers our subscribers can fully attest that the present is but an overage of our issues on the first of each month.

The carefully digested mining summary which we give each week; the chronicles of scientific and mechanical progress; the large and varied information on agricultural matters, and the many matters of general and special interest, together with the numerous illustrations, in all the various departments, combines an amount of information which for value, interest and variety, will not suffer in comparison with any periodical of the day. We trust that those for whom the Press is published will exert themselves to enlarge its sphere of usefulness by extending its circulation, and thus strengthening the hands of the publishers for still greater efforts, feeling satisfied that the benefit will be mutual.

July 2d, 1870.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency. postage paid.

Corporation Notices.

Land Purchasers' Association.

NOTICE.—At a meeting of the Board of Trustees of the Land Purchasers' Association, held August 4, 1870, the following resolution was adopted by unanimous vote: Resolved, That an assessment of ten dollars per share, gold coin, be, and the same is hereby levied, upon each and every share of the capital stock of the Land Purchasers' Association now held by subscribers thereto; being for the monthly installment falling due and payable August 1st, 1870. Said assessment is payable on or before the thirtieth day of August, A. D. 1870, to JAMES F. CROSETT, Secretary, at the office of the Association, No. 304 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, A. D. 1870, shall be deemed delinquent, and will be advertised for sale at public auction, and unless payment shall be made before will be sold on the 24th day of September, A. D. 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. F. CROSETT, Secretary. Office, 304 Montgomery street, San Francisco. jy4

Eagle Quicksilver Mining Co.—Location of Works: Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of July, 1870, an assessment of twenty dollars (\$20) per share was levied upon the mines of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any share upon which said assessment shall remain unpaid on Monday, the 19th day of September, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventh day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. W. COLBURN Secretary. Office, Room No. 26, Hayward's Building, 419 California St., San Francisco, California. jy30

Jennie A. Consolidated Mining Company, White Pine District, Nevada.

NOTICE.—There is delinquent upon the following described Stock, on account of assessment levied on the twentieth day of June, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

KIBBE, Corresponding Secretary Mechanics' Institute, who will forward Premium List, Rules, etc., or application can be made at the Library of the Mechanics' Institute, 27 Post street.

Per order Board of Managers A. S. HALLIDIE, President. GEORGE PARRY, Secretary.

PATENT AGENCY DEWEY & CO.

PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS. Principal Agents west of the Mississippi.—Established 1830. Our appointments are substantial, reliable and complete, for securing patents in the U. S. and EVERY COUNTRY IN THE WORLD where patents are allowed. Our business is large and our exceedingly successful practice justifies the assertion that Pacific Coast inventors can invariably secure their rights at a great deal quicker, and more perfectly, through us, than by any other solicitors—and at favorable rates. Illustrated pamphlets, containing a digest of

Reasons for Success. We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, by COMPETENT AND RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions premiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small affairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

Interferences. INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patents are threatened with interference they should consult able and responsible agents before they either allow themselves to be backed down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Advancing Cases. If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be presently argued before the Examiner, and if possible the decision reversed.

San Francisco Metal Market.

PRICES FOR INVOICES.

GIANT CEMENT.

GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, MINERS' RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hoses without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in TIN CANS ONLY, with full directions. Take no other. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT.

MINERS' RUBBER CEMENT.

The Great Family Medicine of the Age.—THIRTY YEARS have elapsed since the introduction of the Pain-Killer to the public, and yet at the present time it is more popular and has a larger sale than ever before. Its popularity is not confined to this country alone; all over the world its beneficial effects in curing the "ills that flesh is heir to," are acknowledged and appreciated, and as a pain-killer its fame is limited to no country, sect or race. It needs only to be known to be prized.

THIRTY YEARS is certainly a long enough time to prove the efficacy of any medicine, and that the PAIN-KILLER is deserving of all its property is plain for it is annually proved by the unparalleled popularity it has attained. It is a sure and effective remedy. Sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directions accompany each bottle. 4-21-1m

GRANDALL'S PATENT SPRING BED.

COOLEY & GREEN, Proprietors.

Manufactory, corner Front and M streets, SACRAMENTO These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. the country promptly attended to. All kinds of Sash Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy News and Painters.

DR. ABORN

Has Consented to Remain on the Pacific

Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Auzeais House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

Dr. Aborn.—I take pleasure in hearing testimony to your skill and Treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself greatly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.

Oakland, June 3, 1870. WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patient to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he makes a specialty, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon. James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Houghton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hopes of speedy recovery even in the most hopeless cases.

17-21-2m

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

Oil Cake Meal.

THE BEST FEED KNOWN FOR LIVE STOCK.

We desire to call attention to Oil Cake Meal, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal, and in the United States Government Report of the Department of Agriculture for 1865, it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 per cent.; Barley Meal, 13 per cent.; Oat Meal, 18 percent.; Oil Cake Meal, 22-100 per cent. For life-sustaining properties to all stock exposed to sudden changes of weather or over-driving, it has no equal.

For MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other feed; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It improves it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy, and of a much finer quality than when fattened on any other feed, and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness and evenness and glossiness of the hair.

FOR SHEEP there is no article of food known that produces such fine mutton or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price (\$25 per ton) it is the cheapest feed in market. It is now selling in New York at \$42 per ton gold; at \$50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this meal from those on this coast by whom it has been thoroughly tested, has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the manufactory, King street, near Third. All orders will receive prompt attention. Address—

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an obvious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,

Nevada City, California,
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 21 1866; and Oct. 9, 1866.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
New in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Auna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repair. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, wherewith it is drawn through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco. 1v1

ROASTING
OF
GOLD AND SILVER ORES
AND THE
EXTRACTION
OF THEIR
RESPECTIVE METALS
WITHOUT QUICKSILVER.

BY G. KUTSEL,

MINING ENGINEER AND METALLURGIST,
Author of "Nevada and California Processes of Silver and
Gold Extraction," and "Concentration
of all kinds of Ores."**CONTENTS:****I. INTRODUCTION.**

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulfurization; Means of Reduction; Desulfurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chloride.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Changes in Roasting.
B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverberatory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimneys and Flues.

III. EXTRACTION OF SILVER BY LIXIVIATION.

O. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patena Process; Kiss Process; Patena and Rosner Process; Kutsel and Hofmann Process; Augustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets.

This new book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

Every vein miner and millman will find much in it which will show him how to avoid many difficulties, and how to make many improvements, and throughout the book passages are continually occurring which will meet each one's individual troubles to a very considerable extent.

The book is not only a valuable condensation and simplification of much that has already been published, either in German or English, but it goes beyond all others in giving new and practical improvements in the treatment of ores. In the various descriptions and explanations, hints and remarks are being continually made which give it a peculiar value for the coast, and that which is now founded on good practical experience with our various ores.

It is divided into four parts: I, The Introduction, treating briefly of ores, and of Desulfurization, Reduction, and Chlorination in general; II, Roasting of Ores, entering into a detailed description of the various furnaces and processes, and giving explanations of the latter; III, Extraction of Silver by Lixivation, showing how this is done, and when it is advisable, especial reference being also had to amalgamation; and IV, Extraction of Gold by Chlorination.

It contains 142 pages embracing illustrations

WIESTER & CO.,**PATENT BROKERS.**

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

The best HAY PRESS on the Pacific Coast. County Rights, State Rights and Presses for sale.

The only complete GRAIN CLEANER yet invented. County Rights, State Rights and Machines for sale. Every farmer should have one to clean his grain, especially his SEED WHEAT. Send for descriptive circular.

NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.

A CLOTHES RACK for house use, that has no equal. They present an extensive surface for Drying, and can be folded as compact as a jack-knife.

The celebrated patent WHITE WIRE CLOTHES LINE at Two Cents per foot.

The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

NEW LIGHT ON A NEW PRINCIPLE.

Gas for everybody in the city and in the country. Equal to coal gas at one-half the cost. The gas is generated and burned in a new style lamp, and no chimney, no explosion, and no man who is out of business and has a few dollars should fail to purchase a County or State Right and commence making money. Parties owning territory get the Lamps at Manufacturer's prices. Call and examine the light, or write for particulars.

STEAM COOKER.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

WIESTER & CO.,

314 Bush Street, San Francisco.

of furnaces, implements and working apparatus. It is a composition of much care and labor by the author, who has condensed and simplified the form in which the information is given, rendering the book of three more value to the practical man than a more voluminous work would be. It is a work of great merit and value by an author whose reputation is unsurpassed in his specialty. Its price, considering its special character and value, is very reasonable and small in comparison to the information so well rendered in its crowded pages. Price \$2.50 coin or \$3 currency, postage free.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY; 2—CIVIL ENGINEERING; 3—MECHANICAL ENGINEERING; 4—MINING ENGINEERING AND METALLURGY; 5—AGRICULTURE; 6—NATURAL HISTORY AND GEOLOGY; and 7—SEIZER COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 7v161y16p

Important to Assayers.**Crucibles.****The Patent Plumbago Crucible Co.**

Manufacturers of all kinds of

Melting Pots, Portable Furnaces, CRUCIBLES, and other fire-standing Goods, Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger, because rapidly than any other change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible Co.—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

Melter and Refiner, U. S. B. Mint.
Eagle Brass Foundry, 206 Front street, San Francisco, 12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore.

GREENBERG & MOORE.
Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every one obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

CALIFORNIA BRASS WORKS, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs. A. S. Hallidie & Co.—Gentlemen:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adams, Gaudier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and has good and sound as when received. Your Crucibles do not scale off like others, and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

519 Front street, San Francisco

**RIDER'S GOVERNOR CUT-OFF ENGINE,**

Manufactured by the DELAMATER IRON WORKS, WEST THIRTIETH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more case than common engines. NOTE.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application. 26v20-3m16p

Improved Sectional Mills.

We have often received enquiries with regard to some apparatus for grinding bones and the like substances. Raw bones are very difficult to be handled in this way. They are hard and, besides, so tough that they form a peculiarly intractable substance. We illustrate, therefore, very gladly to-day a machine which comes with strong recommendations, and which has been working successfully in manufactories in Philadelphia and Chicago on this material where its great capacity and strength have been demonstrated. They are working also gnanos, plaster, fire-brick, smac, bark, ores, fish scraps and all sorts of substances, and are said to be most efficient. Fig. 1 shows the general appearance of the mill, and Fig. 2 gives a sectional view of the same.

In the old form of iron mills, the grinding surfaces were confined to a system of straight grooves, this form being adopted and used as the only one not too expensive for practical use, not because it was the best. It is easy for any one to see that to use the same kind of surface for every variety of material, was radically wrong. For a substance of a given character, a certain shape and kind of surface is necessary, and as the substance to be ground varies in character and condition, a corresponding variation of the surface is required. By casting the grinding surface in sections, these requirements can be fulfilled. The special advantages of this method, the ease of making necessary changes, etc., need not be further enlarged on here. We proceed with a description of the apparatus under consideration, from which our readers can get an idea of its efficiency.

A is the top breaker, with a projecting arm varied in shape to suit different material, and made to slip over a sleeve which fits on the shaft, so as to protect it and to obviate the need of renewing that much iron with every breaker. The large screw-nut, B, holds the breaker down in place. It is a left hand screw and tightens itself in working. C is the circular grinder, with holes for stud bolts (only one of which is shown) used to hold in place the grinding sections, D, which are eight in number. E is the stationary sectional dress in the upper part of the shell, eight of which form a circle. The corrugations are very deep, so as to admit of a great amount of wear. The outside stationary sections, G, are held in place by the nuts, H. The circular shape of the bottom of the dresses, D and G, admits of a great amount of wear at the bottom, where they come first in contact, and gives greater space, on raising the lever, to allow any iron to get out, which may by chance get into the mill.

I is the cone to which the dress castings, D, are attached. It has a heavy wrought-iron band around the base to support the dress, and is held in place by two feathers, L, in the shaft, and a tight collar below. Wipers, J, carry the ground material to the spout. The main shaft, K, is of wrought iron, but its lower end, which works in the

step, is made of solid steel. There are two feathers, L, let into it, to hold the cone and breakers in place. A steel, conical, anti-friction disk placed under the shaft

supported by M. Levers for adjusting the mill with weights are shown at O; or screws may be used instead. P is the driving cog-wheel, half the size of the other wheel, thus

Fig. 1

E. P. BAUGH'S IMPROVED SECTIONAL MILL.

Fig. 2

SECTIONAL VIEW OF MILL.

effectually prevents heating. The step-box which has a steel lining, is movable. The step moves up and down in a hollow column, M, in closing and opening the mill to adjust the grinding; the shaft working freely through the bevel cog-wheel, N, which is

doubling the power of the belt. Q is a wrought-iron counter-shaft, to which are attached the fixed and loose pulleys, R. S is the fly-wheel, which, with its shaft, is supported by pedestal boxes fitted with anti-friction metal.

The large screw at the top of the mill is used for raising the different parts to change the dress. In order to change the upper parts, the bolts, T, are loosened, allowing the mill to be opened at U. To change the lower grinding surface, the bolts, H, are unscrewed, allowing the mill to be opened at V. Then the large nut, B, is loosened, and the breaker and sleeve are raised, and finally the stud-bolts passing through C are unscrewed, when all the dress can be removed.

There are various sizes made. The largest, "No. 1," is of very great power and strength and is intended to prepare all hard substances for smaller mills, although it is claimed that a large percentage of its product ordinarily requires no further treatment. It is claimed that the hardest substance susceptible of grinding or breaking can be crushed without risk of injury to the mill. The power required to run the machine to its full capacity is from 10 to 12 horses; yet its main shaft being solid wrought-iron, five inches in diameter, it can be run safely with power of 25 horses! The manufacturers state that it can work, in 10 hours, 20 tons and upwards of raw bones varying with their more or less dry condition; 30 to 40 tons of hard guaneros, quartz and other mineral substances; 50 to 60 tons of plaster; and 25 tons of South Carolina guano.

Such is the mill of Mr. E. P. Baugh. It has been the aim of its manufacturers to combine economy and efficiency with simplicity and rapidity of execution, which are especially demanded in America. Testimony to their success is given in a number of certificates. The mill has been secured by patents in Great Britain, France and the United States, and is manufactured by Baugh & Sons, No. 20 South Delaware avenue, Philadelphia, Pa.

THE AMMONIA ENGINE.—The New York Mining Journal gives an illustrated description of Lamm's engine. Briefly, it consists of a reservoir filled with liquefied ammoniacal gas, immersed in a tank filled with water. A pipe leads from the upper part of this reservoir to the cylinder of the engine, and the exhaust pipe leads the gas, after the piston-stroke, into the tank of water surrounding the reservoir. The gas is there immediately re-absorbed by the water, and gives out again the heat which was made latent by its evaporation. By the increased heat of the water, thus produced, the liquefied ammonia in the reservoir is again vaporized ready for work. There is no heat lost, except the mechanical equivalent of the power produced. The journal aforesaid gives, as some of the advantages possessed by ammonia over steam, the fact that the vapor does not condense either in the cylinder, or when used at a distance from the boiler, and the fact that it may remain "bottled up"—so to speak—for years, ready for use upon the simple turning of a faucet. It adds, "Practically, a large central depot could be cheaply erected, with apparatus of capacity to liquefy a quantity of ammoniacal gas sufficient to propel all the street cars of a large city."

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Eureka District, Nevada.

[Continued from page 106]

Jackson and Wilson Mine.

This is located on the same belt as the Champion and Buckeye, and is the same one of which the *White Pine News* published an item some time ago, to the effect that an interest, purchased for \$7,000, had returned to the buyers, in fifteen days the amount paid, besides clearing all mining expenses. I can readily believe the statement, judging from what I have seen. The mine lies under a cliff of quartzite with a gentle pitch to the east, and although work has just commenced, comparatively speaking, (work has been prosecuted steadily only about forty days) and no one can tell definitely how deep or permanent the mine will prove, yet enough has been done to indicate that there is an immense body of ore here, as large as anywhere in the district. The foreman, Mr. Edgerly, was very kind and showed me everything. In the drifts and shafts, above and below, I found ore everywhere. There is one chamber, some twenty feet in diameter, where on the roof, floor and walls nothing but rich carbonate is to be seen. Since the present company commenced work, their furnace has yielded daily two and a half tons of bullion, worth about \$300 per ton in gold and silver. The expense of mining is very light, very little timbering or blasting being necessary. Some 35 men are employed. There are 200 tons of ore on the dump, and 25 tons are sent daily to the smelting works. In the lower side of the hill a tunnel is being run in. They are now in 65 feet, and expect to tap the deposit at a distance of 75 feet.

This and the Champion and Buckeye are simply huge. I was surprised myself at their extent, and I can say that no one will ever regret the expense of time and money incurred in giving this place a visit.

Other Mines.

My enthusiasm has led me to speak so fully with regard to the above mines, that I suppose I must be more brief with regard to the other ones, or the editor's pencil will be drawn mercilessly through my finest sentences. But a short distance from the Jackson is the deep mine owned by Wm. Adams, and Joseph Farren. This is located east of the Marcelina and is a splendid looking one. Drifts have been run in and some 80 tons of good smelting ore are now on the dump. Work has been stopped for the present, but will be resumed soon, as it does not pay to let the ore lie there while it is worth "much monies."

Between this and the Jackson, is the Adams and Farren mine, where a few men are busy drifting. A long tunnel has been run into the deposit, and the prospects are that it will turn out a good mine.

Next to this, on the hill opposite the Jackson, is the Gem mine, owned by W. Frank & Co. This is supposed to be the same deposit, as the Adams and Farren, and has the same kind of ore. The shaft is down 25 feet.

I also visited the Carson ledge, which is situated on the east side of Buckeye Hill and has a shaft 14 feet deep. The prospects are good.

The Eureka Smelting Works.

The pioneer works of this camp, erected by Mr. Buel, and others, are situated at the lower end of the town, and to the right as we come into the place from the railroad. The Superintendent is Mr. Joseph Farren. The 38-horse power engine was made at the Miners, Foundry of San Francisco, and the boiler, 15 feet long and 54 inches in diameter, by the Neptune Iron Works. The consumption of fuel is $1\frac{1}{4}$ cords daily. The fan is a No. 7 Starrevant.

The two furnaces are built of stone,

found in the vicinity, with the lining of sandstone which comes from Pancake mountain. Of these I have spoken before. The height from the hearth to the feed-hole is 16 feet and the stack is 25 feet higher. The charge is simply the carbonates ore with some slag and charcoal. The furnaces, have been running a long time without stopping. They were built by Mr. R. P. Jones, formerly of North Wales, who is generally considered to be a first class workman and to know his business. He is foreman of the smelting department and has been very successful. These works are to be consolidated with the Champion and Buckeye. I met up here Mr. G. Knstel, who came for the purpose of making any necessary modifications and improvements, besides deciding whether it would be better to add one larger furnace or two of the same size, in order to have a capacity sufficient for the business.

Coaquanock—Buttercup—Carpenter's.

The next furnaces are those of a Philadelphia Company, Wallace, Bevan & Co., known as the Coaquanock Mining and Smelting Co. The engine is 8-horse power, the fan is No. 3 Starrevant, the furnace round, 2 feet in diameter in the clear, 7 feet high, and with a stack 20 feet high. They claim to run through 10 to 12 tons of good ore in 24 hours. Three tons of ore produce one ton of bullion. They lately shipped 30 tons of bullion (a 10 days run) to Newark, New Jersey. The freight charge from Carlin to Newark was \$37½, and about \$20 from this place to Carlin.

About 100 feet off, is Col Robbins furnace, known as the Buttercup works. The old furnace is 22 inches in the clear, but the new one, now building, is to be 36 inches square inside. The concern is doing some very good work and is, at present smelting ores from the Kentuck, Mountain Boy and other mines which the company owns.

Next to this is the furnace of Carpenter & Co. Here is a 10-horse power engine with one of Root's splendid blowers. They shipped lately 25 tons of bullion, an 8 days run. They do a flourishing business, principally custom work.

Marcelina—Roslin Works.

The Marcelina furnace is owned by the Jackson Mining Company, and smelts the ore from the Jackson and Wilson mine. It is eight feet square outside and two feet square inside and 24 feet high, with the stack 14 feet higher. It was built by J. D. Williams, an experienced furnace builder. The Superintendent is Mr. H. G. Richmond. The company are alive to new improvements and are about to build a new furnace and put up a new engine.

The Roslin Smelting works are owned by Adam Hall, J. M. Robertson and Moses Wilson, who have secured a large ranch of 160 acres, some two miles up the cañon, and own a large number of mines. They have commenced to build a water-lined furnace, and have all the necessary machinery on the ground. The whole affair will be under the supervision of J. M. Robertson. The upright 16-horse power engine was imported by Capt. Unshing of your city. The boiler is 16 feet long. The jacket was made at the Fulton Foundry, San Francisco. This will have an inch-and-a-half lining of fire-clay, which was bought from the glass works of your city. Equal portions of burnt and unburnt clay are to be mixed thoroughly in making this lining. The cold water passes through the water jacket and thence goes to the boiler, thus utilizing the furnace heat to a considerable extent. Mr. Robertson promised me that he would send you an account of how he gets along. The company feels very confident of success, and we are all interested in their work.

The following results of smelting were collected by Mr. W. T. E. Pitchard for the

Eureka Sentinel, and were given to me when mutually interchanging notes and ideas. They are the amounts and value of bullion extracted up to June 30th, 1870.

Smelting works.	Bullion.	Av. value	Total value.
Eureka Con. M. Co.	374 tons	\$348	\$130,152
Marcelina M. Co.	200 tons	\$350	70,000
McCoy Furnace	110 tons	\$450	49,500
Buttercup M. Co.	100 tons	\$375	37,500
Wallace & Bevan	75 tons	\$350	26,250
Total.			\$313,402

The average amount of coal consumed to one ton of ore is 28 bushels; $3\frac{1}{2}$ tons of ore yield on the average one ton of bullion.

W. H. M.

Eureka, July 10, 1870.

Notes of Travel in Placer County.

[Written for the Scientific Press.]

Rocklin and its Stone Quarries.

EDS. PRESS.—According to promise I send you for publication a hudget of items (or notes of travel) gathered in making the tour of Placer County.

The first point of note which I reach, is Rocklin, situated 22 miles east of the capital of the State. Your readers will doubtless recollect the place, if not the name, from the circumstances of its periodical baptism, occasioned by the necessity of purifying it at least bi-annually from its political sins. Rocklin at present contains about 300 inhabitants. In 1865, during the excitement of building the C. P. R. R., it contained about 1,000 inhabitants. It is the point from which nearly all the blue granite building and paving stone is brought to Sacramento and San Francisco. Messrs. Brigham and Hawes, foot of Third street, San Francisco, own the largest quarry here, and the only one that is now being worked. They employ from 10 to 50 men the year round, and ship by railroad to San Francisco, annually, some 3,500 tons of this, the finest building stone in the State. About \$4 per ton is paid the R. R. Company, to lay it down in your city. The largest Round House on the C. P. R. R., is situated at this place. It has a capacity of housing at one time 28 engines. A large number of mechanics, consisting of machinists, copper-smiths, finishers, etc., etc., are kept constantly employed here, keeping the engines in repair. Mr. M. W. Cooley, the gentlemanly superintendent of the Round House, showed us every courtesy during our visit, allowing us free access during business hours.

The Fruits of Newcastle and Ophir.

Newcastle, some 12 miles further east on the railroad, is an important station, from which large quantities of fruit are shipped both to your city and to the East. Over 30 tons of berries of the different kinds, (strawberries, raspberries and blackberries) were shipped from this one station this year. Mr. Charles M. Silva, owns an 80-acre tract here and has about 10 acres under cultivation. He has cleared from this little spot over \$900 per acre each year, from berries of different kinds. Of strawberries alone he marketed 5 tons this year, and they averaged him 20 cts per pound.

One mile north of Newcastle, diverging from the Railroad, is the little camp of Ophir, containing about 100 inhabitants. Within the town limits of this little camp are at least three men getting rich off of the fruits and berries of from 5 to 10 acres of land each. Messrs. Jemison, Bromley, and Rev. N. R. Peck are the gentlemen in question. From good authority, I learn that these gentlemen clear from \$500 to \$1000 per acre annually. I will not attempt to particularize, but will give an account of a few of the many products of the Rev. Mr. Peck's 10-acre orchard and vineyard. He will market this year from 1500 to 2000 lbs of blackberries, at an average of 20 cts. per lb; 4000 lbs of dried figs, at 18 cts. per lb; from 7 to 10 tons of apples, at 3 cts. per lb; besides several tons of Raisin grape, German prunes, white figs, peaches, plums, Nectarines, &c. They have the best water here and plenty of it.

L. P. Mc.

[To be continued.]

SUTTS.—R. R. and J. Craig of Nevada, proprietors of the Globe Hydraulic Nozzle, have brought suit against R. Hoskins of Dutch Flat, for alleged infringement of patent; also against A. Nevins & Co. of Nevada County.

Diamonds in California.

[Written for the Scientific Press.]

I wish to add a few facts to what has already been published concerning the probability of diamonds being found in paying quantities in California.

As long ago as 1854, in a newspaper article, written by Mr. Melville Attwood, of this city, "On the Importance of an Extended Knowledge of Mineralogy to the California Miner," he says, "I am anxious to call attention to the chance of finding diamonds in this country, and the likelihood of their being overlooked. The rocks in which they occur are common in California. Itacolumite, a soft micaceous sandstone, always the associate of the diamond, is also found here. The gravel always found in the river washings so closely resembles the 'Cascaho' or 'Diamond gravel' of Brazil, that I think it very probable that, if proper search was made, diamonds would be found." Mr. Attwood spent several years in the diamond districts of Brazil, and is familiar with the subject of which he wrote. A few small diamonds have since been found, which proves the truth of his views.

Humboldt in one of his works—"Essay on the Bearing of Rocks"—calls attention to the fact that gold, platinum and diamonds are associates in various parts of the globe; in some places, gold, platinum and palladium, in others, gold, platinum and diamonds. In the river Ahoite, in Brazil, diamonds are found with platinum; near Tejeira, with platinum and gold. These facts awakened in him the strongest hope of finding diamonds in the Ural, where the association of these metals is known to exist. When he arrived at any of his works, he caused the gold sands to be examined microscopically, and if gold and platinum were found, he directed the workmen to look carefully for diamonds. These examinations led to the discovery of microscopic crystals, previously unknown in the gold sands of the Ural—such crystals as in Brazil occurred with gold, platinum and diamonds.

The truth of Humboldt's theory as to the existence of diamonds in the gold sands of the Ural, was proved by the subsequent discovery of a valuable stone by Paul Popoff, a boy of 14, to whom belongs the honor. It was first supposed to be a topaz, but a young Freiberg student, a Mr. Schmidt, who had the necessary instruments to test the hardness and specific gravity, identified it as a true diamond. Two others were soon afterwards found, the third being larger than both the others, followed by systematic search, which has since produced many valuable stones. Diamonds have lately been discovered in Australia. Up to the present time, 759 have been found by the Australian Diamond Mining Co.

The same association of metals occurs in the northern counties of California, especially in the region drained by the Trinity river, in the sands of which microscopic diamonds are actually found. The same may be said of the vicinity of Coos Bay, in Oregon, and along the banks of Smith river, in Del Norte county. Miners throughout this whole region should search carefully for diamonds, and should send anything they find, which is likely to be such, to some competent and reliable mineralogist for identification. Diamonds may be looked for in flumes and in cleaning up sluices, with gold and platinum.

The platinum so common in the region alluded to, is also valuable. It can be saved and sold at a profit. Miners are generally mistaken as to its value, some believing it to be more valuable than gold itself. Chemical examination of samples from those localities show it to contain considerable iridium and osmium, which lessens its value as compared with pure platinum. Mr. H. M. Raynor, 25 Bond st., New York, will purchase any quantity of crude platinum sand containing 33½ per cent. of platinum, at a price which will, no doubt, pay for saving it. Those interested can address him on the subject, and depend upon receiving all the information they may require. The whole topic is well worthy of the attention of miners.

HENRY G. HANKS.

Mechanical Progress.

A NEW TELEGRAPH.—Signor Guattari, an Italian has invented a novel apparatus for sending messages, which is thus described in the *London Telegraph* of the 12th ult: "The inventor charges a reservoir with compressed air, and by the operation of valves sends pulsations through a tube, which pulsations are made to work upon the receiving instruments with an effect corresponding with that of the electric current passed along insulated wires. The Royal Institution of Naples has paid to Signor Guattari the rare compliment of a gold medal. At the experiments yesterday the working apparatus was all contained in a stand or table, eight feet long by five wide and four deep. Air pumps, worked by a crank, are used to charge the reservoir. The amount of pressure is shown upon a dial. The telegraphic instrument is worked by hand in the ordinary way. A very considerable pile of gutta-percha tubing, half an inch in diameter, and said to be about a mile in length, was connected with the instrument at the battery and with two other instruments in the room. The experiments began by the charging of the reservoir to about one-sixteenth of its actual capability, this being a comparatively crude machine. The method for the working is the Morse, or printing cipher system. Signor GUATTARI, at the transmitting end, sent through, message. The words were recorded in cipher, at the receiving end, and read off.

"Experiments were tried on the apparatus for communicating with various parts of a ship, and with what may be called the domestic telegraph. In this case Signor G. dispensed with the use of the reservoir, and by mere manipulation of an air ball at the end of a tube recorded cipher characters on the strip of paper of the receiving instrument. This is the kind of telegraphy to which the apparatus will probably prove best adapted. In large hotels, in ships of war, in communication from factories to counting houses, from private residences to places of business, and in town communication generally, the system promises to be advantageous.

"The inventor claims that his apparatus will be less expensive than electric batteries, and less subject to the influence of storms."

THE 35-TON GUN.—*Engineering* gives from an exchange an account of the forging of an immense coil, which is to form a part of the 35-ton gun now constructing at the Royal Gun Factory in Woolwich. We quote: "The men being all at their posts, and the gigantic tongs of 12 tons weight being brought into position, the iron door of the furnace was raised. The tongs, swinging from one of the steam cranes, and manned by nearly twenty men, were thrust into the furnace, and drew out the massive coil. The crane being slewed round, the coil was carried to its place, and deposited under the steam hammer. The outer coil weighed nearly 11 tons, being formed of eighteen ordinary bars joined together at the ends, the total length being 201 feet. The inner coil, 170 feet long, weighed about 9 tons, making a total of 20 tons. In a minute after the coil was withdrawn from the furnace the great hammer began its work, thundering down upon the white hot metal, speedily reducing the height of nine feet or more, which the cylinder originally possessed. The broad face of the hammer, having a diameter of nearly 5 feet, was insufficient completely to cover the upper end of the coil, but the latter was shifted. Presently a hollow mandrel was placed, point downwards, on the upper end of the coil, and driven into the center of the mass. The coil was then thrown on its side, and made to rotate on the ground while the hammer struck its sides. The entire operation was most satisfactorily performed, its object being to weld together the whole of the coiled bars into one compact mass.

STONE-BREAKER JAWS.—At the late Oxford Show of the Royal Agricultural Society. Mr. Marsden, the English agent for Blake's stone-breaker, exhibited one of those machines, designed by him for preparing road-material, in which the fluted surfaces of the jaws were so formed, that the projecting ridges were directly opposed to each other, instead of being as heretofore alternated. The square opening thus formed, constituted a sort of gauge for the size of the broken material.

WHITE GUTTA-PERCHA.—The *Journal of Applied Chemistry* gives the following method of preparing this for dentists' use, and for other purposes. Four ounces of pure gutta-percha is digested with five pounds of methyl-chloroform until the solution is thin enough to pass through filtering paper. It is then filtered (an additional pound of chloroform will facilitate this), and should then be clear and nearly colorless. Alcohol is now added in sufficient quantity to precipitate the gutta-percha in a voluminous white mass, which is washed with alcohol, pressed in a cloth and dried in the air. It must finally be boiled in water in a porcelain vessel for half an hour, and while still hot rolled into sticks. The chloroform can be separated from the alcohol by adding water, and the alcohol recovered by distillation.

STEAM ENGINE NOTES AT THE OXFORD SHOW.—We select one or two items from *Engineering* of July 22d. In an engine exhibited by Clayton & Co., the arrangement for clearing the steam jacket of the water resulting from condensation, consists of a vessel placed beneath the cylinder, and furnished with two cocks, one—the upper one—communicating with the jacket and the other with the atmosphere. Under ordinary circumstances the upper cock is open and the lower one closed, and the water arising from condensation thus collects in the vessel. To discharge it the upper cock is shut and the lower one opened, when, of course, the water is at once forced out by the steam generated from the water on the relief of the pressure.

Messrs. Aveling and Porter's handy little crane-engine of the "Little Tom," pattern stands in about the same relation to ordinary traction engines that an elephant in his natural state bears to the same animal deprived of his trunk. By the aid of the crane at its front end, it can lift any article to be transported, walk off with it, and put it down again exactly in the position it is wanted. The whole machine, with its hoisting, lowering, and traversing motions, is completely under the control of one boy. Another exhibit of Aveling and Porter is their new 5-horse agricultural locomotive. In this engine the reversing gear consists simply of an eccentric mounted on a sleeve capable of being turned on the crank shaft by means of a lever having a pin entering a spiral slot in the sleeve. Thus by moving the lever parallel to the crank shaft, the eccentric can be turned round from the position corresponding to forward to that required for backward motion, or *vice versa*. Within certain limits, also, this gear can be used as an expansion gear, but the range of expansion obtainable by it is but moderate, on account of the rapid increase effected in the lead of the valve as the eccentric is moved round from its full gear position.

HAMER'S OSCILLATING REVOLVING CYLINDER ENGINE.—This was on exhibition at the Agricultural Hall in Islington, on July 16th. *London Engineering* says: "In this engine there is at the bottom of the cylinder, which is vertical, a ball working in a cup with steam passages through them to the cylinder; the steam acting on the piston in the ordinary way, the ball with the cylinder oscillates in the cup, revolving at the same time, and by so doing, the cup, ball and cylinder are always kept true. Mr. Hamer dispenses with slide, slide box and rod, connecting rod, eccentric and hand, connecting rod from crank to piston rod, guides, &c. If for a reversing engine or a pair of engines, Mr. Hamer places a slide and box attached to the two pipes from the under side of the cup, the steam passing to the slide box. By moving the slide with a hand lever the steam passage is changed to exhaust passage, and the contrary, and stops or reverses the engine at pleasure without the use of gear work. It is a very simple arrangement and works exceedingly well."

NEW ARTICLE FOR UPHOLSTERERS' STUFFING.—A New Hampshire inventor has patented an article which is thus spoken of by the *Cabinet Maker*: "It consists in a new preparation of wood, suitable as a stuffing for upholstery and other work or purpose, obtained by a saw of peculiar dress, whereby it cuts off from the side of a board not enough to make a veneer and too much to make dust. This product is entirely different from a stuffing made from wood cut by a plane into mere curls, and is superior to the latter in many respects as a filling."

Scientific Progress.

A NEW CROCODYLIAN FROM THE EOCENE OF NEW JERSEY.—Prof. O. C. Marsh describes, in the *American Journal of Science and Arts* for July, some reptilian remains from the Eocene green sand of New Jersey, recently received by the Museum of Yale College. "They indicate," he says, "a new species of Gavialis, considerably smaller than any Crocodylian heretofore discovered. The specimens, which were found together, and are evidently parts of the same skeleton, consist of various fragments of the skull, and ten vertebrae." The animal to which they belonged was slender, and about six feet in length. Prof. Marsh places it provisionally in the genus *Gavialis*, and calls it *Gavialis minor*.

MELTED IRON IN HYDROGEN.—M. Caron observed that iron, when it is kept melted for some time in an atmosphere of hydrogen, somewhat increases in density, and becomes soft and malleable as copper. Remelted in a crucible, it becomes scaly when cold, doubtless in consequence of the evolution of absorbed hydrogen.

THE FUEL OF THE SUN.—This is the title of a new book by W. M. Williams, F. C. S. His theory is that an atmosphere much like that of the earth, though more attenuated, pervades all space, and that this atmosphere furnishes the sun's supply of fuel. We quote: "It is evident then that the first result of the great evolution of heat from mechanical condensation of the mixed atmosphere of aqueous vapor, carbonic acid, and free oxygen and nitrogen, will be the dissociation of the water and the carbonic acid. But there must somewhere be a height at which the temperature capable of effecting dissociation terminates; where the atmosphere of elementary gases fringes upon that of combined aqueous vapor, and where these separated gases must revert into re-union with a furious chemical energy which will be manifested by violent combustion. Thus we shall have a sphere of dissociated gases and a sphere of compound vapors separated by an interlying stratum of combining gases, a spherical shell of flame, constituting exactly what solar observers have described as the 'photosphere.'"

GEOLOGICAL SURVEY OF TEXAS.—Prof. Roessler, who has just returned from an expedition into Northwestern Texas, which was cut short by an Indian attack, writes the *New York Engineering* that no other State in the Union offers so interesting a field for the geologist as Texas. It contains "a complete series of geological formations, ranging from the Potsdam sandstone up to the latest tertiary, with an abundance of organic remains and an immense mineral wealth as yet hardly known to the people themselves." The Permian formation, known to be elsewhere rich in copper, nickel and cobalt ores, is extensively developed in the State. On Big Wichita river, Prof. R. found "the fossil remains of a complete skeleton of an indescribable species of the genus *Elephas*, greatly superior in size to that of *Elephas primigenius*, mastodon, or any other known species." An editorial article in the same issue of the above named journal, says that the jaw-bone of this skeleton measured twelve feet in length.

A NEW TEST-PAPER.—*Cosmos* says that M. Böttger has produced a highly sensitive new test-paper for alkalies. The reagent is a magnificent coloring matter, obtained from the leaves of an exotic plant, (*Coleus Verschaffeltii*) upon digestion for 24 hours, with absolute alcohol, to which a few drops of sulphuric acid has been added. The paper is prepared by the usual process. The color is a splendid red, which passes more or less rapidly into a fine shade of green. It is far more sensitive than either turnsol or turmeric; it is unaffected by carbonic acid, and will indicate the presence of the least traces of the carbonates of the alkaline earths in natural waters. A moistened strip of the paper, when held at the opening of a gas jet, immediately assumes a green color, from the effect of the ammonia.

EVIDENCE OF VOLITION IN PROTOZOA.—Dr. Engelmann has observed in *Arcella*, a minute protozoon like an *Amoeba* with a shell, a periodical development of gas. He describes minutely how gradually in the protoplasmic hyaline substance of the animalcule, black points arise, which as gradually coalesce, forming a distinct air bubble. This gas can after a time be absorbed again, and reasons are given for believing that a sort of volition is exercised by the *Arcella* in the secretion and absorption of the gas, which they use in the manner of a float or air-bladder. The air bubbles are not connected with the contractile vacuoles, or with the nuclei. The air bubbles do not occur in the non-granular protoplasm, but in the granular substance, and are of irregular form. The chemical composition of the gas was not determined, nor the mechanism (if any exists) of the formation and disappearance of the air bubbles. The discovery is of importance from two points of view: in the first place, for the development of gas in protoplasm as a physiological phenomenon; in the second place, for the supposed voluntary nature of this development, of which this exceedingly simple organism makes use for the purpose of locomotion.—*Quarterly Journal of Science*.

SODIUM AS A FLUX FOR MINERALS.—The following is the method adopted by Dr. Schonn: "A steel crucible 1½ inches deep and the same in diameter, is brought to glowing over an ordinary lamp. Into this are projected a few pieces of metallic sodium, and afterwards the finely divided and dry mineral is added. The crucible is then covered and heated red hot. As soon as the reaction is finished the contents of the crucible are allowed to cool, and water is cautiously added sufficient for the purpose of filtration. The fused mass is then thrown upon a filter and thoroughly washed. In the filtrate will be found the electro-negative constituents of the mineral combined with the sodium, such as sulphur, cyanogen, chlorine, chromic acid, silica, molybdic and tungstic acids and such oxides as are soluble in the soda lye. On the filter will be found the metals and their oxides, also the lower oxides of titanium, molybdenum, tungsten, and possibly silica and alumina. The contents of the filter and the solution in the filtrate can be further treated according to the order of analysis."

ACTION OF PEROXIDE OF MANGANESE ON CHLORATE OF POTASH.—In preparing oxygen by means of these substances, the action has been explained on the principle of catalysis. Krebs gives a new explanation: "The temperature of infusible bodies increases upon addition of heat very rapidly. * * In a mixture of black oxide of manganese and chlorate of potash, the manganese is the first to become rapidly hot and it immediately gives up its acquired heat to the chlorate and thus promotes the hasty decomposition of that salt. If hot oxide of iron be projected into fused chlorate of potash, the evolution of oxygen takes place very violently. In like manner other infusible bodies which are not decomposed by the chlorate, promote its decomposition, as for example, oxides of tin, zinc, calcined gypsum and the like. This explanation of the action of solid bodies to bring about the liberation of oxygen from the chlorate of potash is more rational than the old notion of catalysis, and may be safely accepted until a better one has been offered."—*Journal of Applied Chemistry*.

FUSING IRIDOSMINE.—We take the following from the "*American Chemist*" the new publication which will take the place of the American reprint of the *Chemical News*:—Moses G. Farmer, of Boston, has fused the native iridosmine by placing the natural grains in a groove in charcoal, and subjecting them to the action of a current of voltaic electricity from sixty large Bunsen cells, using large platinum wires to make contact with the ends of the groove. He obtained in this manner hare of perfectly compact metal, brittle and very hard. Mr. Farmer estimates the temperature of the fusion at about 10,000° F. The object of the experiment was to prepare a bar of the alloy for the purpose of electric illumination. On rendering it luminous by an electric current, he found that when near the melting point, one square inch of surface evolved light equal to 2,800 candles, which threw shadows in broad daylight at noon, and produced excellent photographs. The same battery converted solid hydrochloride of iridium into fused metal, as soft and ductile as platinum.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

LEVIATHAN.—*Miner*, Aug. 6th: The enopla blast furnaces, after a re-modeling of the hearth, was started again this week, and several tons of ore smelted with satisfactory results. The arch, however, gave way.

The Monitor and Northwestern Silver Mining Co., owners by recent purchase of the property formerly belonging to the M. O. M. Co., are fully organized. Headquarters are in Milwaukee, Wisconsin. The work will be pushed. The drift is expected soon to cut a deposit of the rich, soft Tarsish ore.

GLOBE.—*Chronicle*, 6th: Work has stopped on account of non-arrival of funds.

TARSHISH.—The lower tunnel is going ahead, at the rate of thirty feet a week. It will take five weeks longer to reach their ore deposit.

AMADOR COUNTY and no

AKKRY LOW DEEP.

WILLIAMS.—*Ledger*, Aug. 13th: This mine, better known as the Markles, is four miles from Volcano, near Foster's ranch. This shaft is down two hundred and ten feet, with a vein five feet in width, yielding quartz that pays \$50 to the ton.

VOLCANO.—This ancient town holds its own better than any camp in this county. Although water is scarce at this season, there is a large amount of gold taken out each week.

PIONEER.—This mine, five miles above Volcano, has for some time laid idle. A company from Philadelphia have taken it in hand and commenced work.

CASCO.—J. R. Hardenberg returned to Amador, backed by capital, to continue work on the Casco mine. It is the intention to sink 300 feet deeper, by contract. The new Co. is styled the Chicago Milling and Mining Co.

CALAVERAS COUNTY.

CHLORINATION WORKS.—*Chronicle*, 13th: Mr. C. J. Garland is erecting chlorination works in Lower Rich Gulch, for the purpose of treating the sulphurets from the Palomo and Alexander mines. Mr. G. expects to commence reducing in two weeks. The furnaces for roasting will have a capacity of two tons.

INDEPENDENCE.—Cor. of same: The owners of the Cudell claim have sunk the main shaft 130 feet, and are now running levels. The quartz extracted while sinking yielded \$40 per ton. Sundermier & Co. have a shaft 50 feet in depth, and a ledge 2 feet in width. The ore looks promising. The Bald Eagle, Gamble & Co., have had one crushing, which paid, over expenses, \$30 per ton. The Freeman Bros' shaft is down 80 feet, and they have had one lot of assorted rock worked, which yielded \$70 per ton. Lewis Bros' claim may be set down as the richest mine in this neighborhood. The owners have erected steam hoisting works, propelled by a 40 horse power engine. They have in course of erection a battery of ten stamps. They have sunk this main shaft 160 feet, and are engaged, night and day, with 15 to 20 men. The last rock they had crushed paid \$300 per ton. At the Lefoy they have attained a depth of one hundred and fifty feet. They have crushed one lot of ore, only, and that yielded \$40 per ton.

In the immediate vicinity of Railroad Flat there are but few mines worked. The Petticoat has been for two months at a standstill. Many rumors are afloat in regard to a change of ownership. On the Pints claim they have a shaft down 60 feet and flattering prospects. The Buckeye commenced a south drift at a depth of 60 feet, and have been rewarded by a ledge 18 inches in thickness, showing free gold in every piece.

INYO COUNTY.

ITEMS.—*Independent*, Aug. 8th: Around the works of M. W. Belshaw, Cerro Gordo, are stocked \$25,000 worth of ore, coal, &c. Mr. Beaudry is building a new smelting furnace on the most approved plans. At Swansea, the smelting works of the Owens Lake Silver Lead Co., are kept in constant operation, running out stacks of silver lead bars.

LOS ANGELES COUNTY.

QUARTZ.—*News*, Aug. 13th: Yesterday a well known professional man of this city exhibited to us several pieces of gold-bearing quartz, in size from a hickory nut to a hen's egg, which were rich almost beyond belief. The quartz and gold were so intermixed that we could scarcely believe that it was not a solid mass of the precious metal. We are assured that the ledge from

which the specimens were taken is in this county, at a point easily accessible. The parties are reticent concerning its whereabouts.

NEVADA COUNTY.

SOUTH YUBA GRAVEL CO.—*Transcript*, 11th: This company has a tunnel run around on the rim rock, one side of the tunnel being in gravel. We learn this gravel prospects two hits to the pan, and the gold is coarse. This company has resolved to incorporate. It is their intention to put up hydraulic works.

IMPORTANT ENTERPRISE.—Same of 12th: Messrs. Eddy, Ball, and others have arrangements for running a tunnel from the South Yuba side of the ridge to their claims near French Corral. The tunnel will be 2,000 feet in length, having a width of ten feet, and will be run on a level to drain Empire Flat, and most of Kate Hayes Flat. It will open a bed of rich cement gravel forty feet in depth, and many acres. The intention is to have two tunnels put down the entire length and extend them beyond the mouth as may be desirable, as there is plenty of fall. By this means they calculate that the cement, which they have been crushing in stamp mills, will be completely disintegrated and the gold set free.

KANSAS MINE.—*Gazette*, 9th: This company are down 226 feet with their shaft. They have passed through twenty feet of boulders and gravel, and reached bed rock. They have a tunnel commencing ten feet above the bottom of the shaft, which they have run 140 feet over and through boulders from ten to twenty feet thick. The gravel prospects well. There appears to be no doubt this company are in the main channel—a continuation of the Live Oak and Nebraska. The explorations go to prove a large gravel range up the Washington ridge. Half a dozen companies are anxiously watching the development.

SINGULAR FORMATION.—Same of 10th: Between Washington and Phelps Hill, is a stratum of slates and plumbago, 300 feet wide, which has been traced 2,000 feet. This deposit is almost as soft as pipe clay. At either end its course appears to be cut off by enormous ledges of barren quartz. Various assays have been made which range from \$4 to \$26 a ton. The ledge has been located and 1,000 pounds of this material is at Stiles' mill to be thoroughly tested.

GRAVEL ON WASHINGTON RIDGE.—Same of 13th: Recent explorations of the ground on the ridges beyond Henefauth's go to show that the gravel channel runs directly through from this Yuba to the Deer Creek side. The main channel appears to be half a mile wide. From the highest point to the bed rock is 400 feet and the bottom of the channel is 250 feet, above the Yuba river. On this bed rock is blue gravel similar to that at Moore's Flat, Relief Hill, You Ber and Dutch Flat. There are five companies that propose to make extensive developments, viz: Henefauth, South Yuba, and Filibuster on the north side, and the Spring Hill Slide and the Bell Clapper, on the south.

PROSPECTING.—*Grass Valley Union* 10th: The Gold Hill mill has been running for six weeks, on custom work, sent by the prospecting companies. The results have been in many instances astonishing. This mill has rock enough to keep it in work for a month.

TORNADO.—Same 11th: a force of miners was put on yesterday.

NORTH BLOOMFIELD G. M. Co.—*Transcript*, 15th: This Co. are making good progress in rebuilding their flumes, destroyed by fire, and will have their ditch running water in September. They employ over three hundred men.

ROUGH AND READY.—Extensive prospecting in the vicinity of Randolph Flat. The Webster and Grant & Coombe are working with encouraging prospects, and work is prosecuted by the Torphey, McSorley, Green Mountain, and Griffin companies on the Squirrel creek side of Bunker Hill. Griffin is to commence hydraulicing soon. The Black and Landis are running a tunnel near Deer creek to tap their gravel. The Portuguese Co. are not washing but blasting a cut.

MOORE'S FLAT.—The Boston Co. cleaned up Friday \$5,000 from four weeks' run. Bedington, of the Hickey claims, picked up a specimen weighing five and three fourths ounces.

BLUE TENT.—The Killam Co. are running a bed rock tunnel in their claims preparatory to a big blast. They intend to use seven hundred kegs of powder at one time.

MULBERRY LEDGE.—Same of 16th: The incline is down 85 feet, and from that point they have commenced a drift from which to stope out while the sinking will be continued. The first crushing from ore

near the surface, yielded \$11 a ton, but the average of three crushings has been \$15. At the bottom of this incline, the vein is eighteen inches in width.

PLACER COUNTY.

FIRST DUST OF THE SEASON.—*Stars and Stripes* 11th: We understand that the river claims at Rattlesnake have begun to yield. On Saturday John McBride purchased a considerable amount of dust. The indications are promising.

SAN BERNARDINO COUNTY.

COX RANCH.—*Guardian*, Aug. 6th: Parties this week from the mines report that Hubbs & Co. have had a clean up from their arastras, and obtained satisfactory results. We understand that the company intend erecting machinery.

SAN DIEGO COUNTY.

JULIAN DISTRICT.—A Los Angeles telegram of the 13th says: The mining interests are reviving. Mills are running on rock paying from \$25 to \$100 per ton. The owners of the Stonewall Jackson have received a quit claim deed to half their claim, 1100 feet, by surrender of the other half, conditional on confirmation of this grant.

SIERRA COUNTY.
GIBSONVILLE.—Cor. of *Messenger*, 13th: Doty & Jones have struck dirt in the "Shoo Fly," which pays from fifty to five hundred dollars to the pan.

The general impression is that the Mount Pleasant ledge will turn out a big thing.

SISKIYOU COUNTY.

WILL COMMENCE.—*Yraska Union*, August 10th: Lash & Co., of Humboldt, will commence to run their quartz mill this week. Their ledge is three to five feet thick, and the rock worked, has yielded an average of \$15 to the ton. This claim is opened well, and the cost of mining and milling will not exceed six dollars to the ton.

TUOLUMNE COUNTY.

The *Sonora Democrat* of the 13th says that Shstuck's quartz mill at First Garrote, has suspended operations and it is doubtful when they will be resumed.

Arizona.

WALKER DISTRICT.—*Prescott Miner*, July 30th: N. B. Bowers, General Coe, Dr. Soule, Messrs. Cruger and Tiernan, went up to Lynx Creek this week. They found Uncle Billy Pointer and C. Y. Shelton hard at work grinding ore in arastras. Some placer miners were at work.

HASSAYAMPA.—Ons man took out, in two days, two and a half ounces of coarse gold, and two men, in one day, an ounce and a half. Frank Alters and Sam. May talk of digging a ditch to carry water into some rich gulches, near the head of the Hassayampa, in which Frank has made excellent wages with a rocker.

STERLING.—Capt. Garretsee got back from San Francisco last week. We learn that he is going to run this mill, provided the supply of water keeps up. Mr. Wertheimer, who visited the mine Tuesday, informed us that Mr. Garretsee had found very rich bonny-comb rock, in a new place in the Sterling.

British Columbia.

KOOTENAI.—*Walla Walla Union*, Aug. 6th: From John Galbraith, just down, we learn a new camp has been struck, called Palmer's Bar, with good prospects, the claims yielding from \$14 to \$40 to the hand. A company has been formed to bring water from the Moyea river, 6 miles; washing was just commencing in both the old camps, Perry creek and Wild-horse.

Idaho.

ITEMS.—*Avalanche*, 13th: It is reported that the Sherman mine in Flint district has been sold to Chicago capitalists. The New York mill has shut down until the arrival of quicksilver. There are 300 Chinese in this placers below Wagon town, making \$2 to \$5 per day to this hand. John McMabon has made another strike on War Eagle. This ledge is small but very rich. He has christened it the Humming Bird.

SNAKE RIVER MINES.—*Boise City News*, Aug. 6th: Conflicting reports are received. A friend from there a few days ago informs us that they are better than he expected. Yet there are hundreds of men who own no ground. Claims have been sold at from fifty to a thousand dollars. Our informant thinks that if a man has any kind of a "decent thing" at home he would advise him to stay.

THE BASIN.—The editor of the *Chronicle* has made a trip through the Boise Basin. From his notes we call the following: The Gold Hill quartz mill, near Granite creek, runs its 25 stamps and 4 pans day and night. A nine days' run cleaned up \$6,000. The Yellow Jacket mill is nearly completed. It is the 10-stamper formerly

on the Gsmbrinus ledge, near Idaho City. A tunnel one hundred feet in length runs in on this ledge. From a paufull of the decomposed quartz we saw \$12 washed out. In another week the mill will be crushing. They have 300 tons of quartz to begin on. On the opposit mountain a company have commenced running a tunnel on a new ledge and are in 50 feet.

Montana.

PILGRIM BAR.—*New North West*, Aug. 5th: On Sunday Catching & Co. cleaned up \$3,125. Walker & Co., \$3,600; Blair & Co., \$4,500; Beery & Co., \$4,489; and the other claims on the baran average of \$900 to each string of sluices. Beery & Co., shifted one string of boxes last week, and were hardly started on their good ground. They expect \$7,000 to \$8,000 this week. Water is failing.

GERMAN GULCH.—From Mr. Fletcher, we learn that there are 125 men now at work, and the head rock flume companies, of which there are 13, got fairly to cleansing up July 15th. This gulch is paying from \$6 to \$30 per day to this hand. The California Co., working 8 men, and having the best ground and dump in the gulch is yielding an average of \$30.

CEDAR CREEK.—Cor. of same: Homeward Bound, Co., on No. 11, O'Keefe's District, after attaining a depth of forty feet were driven out by water, which caused a few members to withdraw. Ten reorganized srs making larger pumps and ars bound for bedrock. In Sunriss Gulch, 17 claims were sluicing, none taking out less than \$7 to this hand. On No. 18, 11 ounces were sized one day last week, to six men. The ground is known to pay from No. 2 below to No. 25 above discovery, where the water is getting scarce. At No. 30 above, the water sinks, but men packing dirt in sacks from the northern divide to a spring, washed out \$7 to \$8 per day to the rocker. In Lost Gulch, work has ceased, and claims are laid over to November 15th, by a miner's vote; the parties being at present short of means to pay expenses while opening them.

Cedar Cor. of *Helena Gazette* says: Many of the claims are paying from \$10 to \$25 per day to the hand. I saw two clean-ups of one day's run each, in two strings of sluices, of over \$200 each. For four miles above Forest City the claims are being prospected.

New Mexico.

ELIZABETHTOWN.—*Press and Telegraph*, Aug. 6th: The Chester quartz mill has been steadily running 20 stamps. For some reason, known to the Co., no returns are allowed to be published.

RIO HONDO.—This spring, a company headed by Peter Welch started a cut three miles from this head of the gulch, and have run 500 feet. Not having any sluice boxes, they save no gold, but the prospects justify them in continuing until they strike bedrock. They have found pieces of gold as large as beans. This side of this gulch being very high and steep, it is expected that the diggings will prove very dssip, possibly 30 or 40 feet.

Nevada.

COPE DISTRICT.

The *Chronicle* of Aug. 11th, notes shipment from Elko for the half week, of about 87,000 lbs. crass bullion and 20,000 lbs. ore; all to S. F. except some 6,000 lbs. bullion to New Jersey. Treasure from Cope per W. F. & Co. \$2,300. Sams of 14th, notes \$3,000 treasure from Cope. During the 70 days from June 4th, to Aug. 13th, \$55,441 treasure from Cops.

ESMERALDA.

DUUNDERBERG.—Cor. of *Inyo Independent*, July 30th: Recent developments show that this is a rich mine. One hundred feet in the first north extension was sold a few days ago for \$1,800. The Carson Appeal says, Levi Dagus has taken a contract to erect upon the Duunderberg a first class mill.

DELMONTE.—This property has been purchased by A. P. K. Harmon, of San Francisco, for \$13,000. A. L. Greeley, of Virginia, has purchased from him the "Stark and Tucker" and the "Old Antelope" mills. The Wide West mill will start about the 1st of next month.

Oregon.

SPANISH GULCH.—*Dallas Mountaineer*, Aug. 6th: The mines are on the Canyon City road, one hundred and forty-five miles from this city. They were discovered 8 years ago by a party of Spaniards, who sunk a 20-foot shaft, but left on account of the water and the Indians. Some years after, Dr. McCoy and others dug a six-mile ditch from Rock Creek, but it broke several times, and little work was done. This spring they went at it again, put up a hydraulic, and repaired the ditch. Week

before last, they made their first clean-up after a run of 31 days. It amounted to over \$2,000, an average of \$14. per day to the hand.

Several new companies have been formed in the region.

HUMBOLDT.

ITEMS.—*Silver State*, Aug. 12th: Jack Cavanaugh & Co. are down on their ledge over 100 feet, and are having a fine show.

THE ARIZONA is vomiting forth precious mineral at the rate of 50 tons per day. Float Rock has been discovered near Star Peak, assaying \$3,002 per ton. The ledge is believed to be a blind one. Jake Hawley has a fine lead on the south side of Main street, Unionville.

ON A NEW BASE.—The Sacramento and Humboldt Mining Co. have instituted a suit against Fall & Temple for the ground lately in dispute between the Silver Mining Co. and Fall & Temple, upon the Arizona ledge. The S. & H. M. Co. is the same company re-organized and incorporated under California laws.

REESE RIVER.

BULLION.—*Reveille*, 9th: The Manhattan Co. shipped yesterday through Wells, Fargo & Co., 7 bars of bullion of the value of \$12,123.21. Same of 10th: Yesterday the Manhattan shipped 9 bars weighing 830 pounds and valued at \$14,007.83.

MILL STOPPED.—Same of 13th: The mill at Hot Creek has stopped, for the present, for the want of ore.

The quartz mill at Washington, owned by the Utica and Herkimer Co., will start in a few days.

Austin telegram, of 16th: The Manhattan mill is turning out fine bullion with the Stetefeldt furnace. They ship to-day five bars, valued at \$8,981.73, and will ship twenty-two bars to-morrow.

WASHOE.

YELLOW JACKET.—*Enterprise* Aug. 14th: Daily yield 200 tons, from the 900 and 1,000 foot-levels. The drift north at the 1,000 foot level is being energetically driven. One hundred and ten feet will carry it to the winze. The drift, however, will strike the ore before it reaches the winze.

CROWN POINT.—Daily yield 50 tons low grade ore from the upper levels. The quality shows some improvement, especially that from the 160-foot level. At the 800-foot, a small vein of pretty good ore is found 3 feet wide. July receipts, \$20, 182. 73.

OPHIR.—A quantity of ore recently crushed yielded a couple of thousand dollars profit. The ore was from the upper works and had for some time remained on the dump. A quantity of ore has been developed near the old Moscow incline. The tunnel north from the 700 foot level is in 225 feet.

GOULD AND CURRY.—Daily yield 50 tons from the upper works. At the Potosi section a body of ore has been discovered which yields 15 tons per day of good quality. The balance principally from El Dorado section.

CHOLLAR-POTOSI.—The yield for the week is 1,654 tons, averaging per assay \$67. 21 per ton. No new development.

SIERRA NEVADA.—The ore is much improved, and the quantity of bullion produced is greatly in excess of former yields. The new pan is working satisfactorily.

KENTUCK.—About 30 tons per day mostly from the upper levels, with a few tons from between the 800 and 900 foot. All efforts to effect an opening to ore known to exist between the 500 and 600 foot levels have been defeated. There is still fire in this section.

SAVAGE.—About 75 tons per day extracted, which mills \$20 per ton. All prospecting work has been discontinued, except the sinking of the main shaft, which is 85 feet below the eighth level.

HALE & NORCROSS.—The daily yield is 230 tons, generally from the 1,200 foot level. The winze at the bottom has been sunk nearly 100 feet, and discloses good ore all the way. All the developments are of most gratifying character. The receipts of last month were \$200,833.

OCCIDENTAL.—All matters are being carried out in a satisfactory manner for supplying the new mill with ore. It will be started in a few days.

IMPERIAL-EMPIRE.—The bottom of the shaft is in favorable looking matter. The cross-cut at the 1,200 foot level shows favorable looking quartz.

SACRAMENTO AND MEREDITH.—Everything progressing satisfactorily. There is no want of ore. The mill is run constantly to its full capacity.

CONSOLIDATED VIRGINIA.—The tunnel at the 500 foot station is in 575 feet. The

ground is favorable. The upper works are yielding the usual amount.

CALEDONIA.—Yielding well from the 200 foot level. Arrangements have been made for working through the American shaft.

BELCHER. Good progress made in re-opening the southwest drift at the 420-foot level. Some increase of ore is found in a winze sunk ten feet below the 150-foot level, north.

SEGREGATED BELCHER.—Daily yield 25 tons of fair ore. The drift makes a good showing on the 400-foot level.

SUTRO TUNNEL.—The Suro Tunnel was in 1,440 feet yesterday. The rock is exceedingly hard.

HORE.—About 40 tons of \$25 ore continues to be the daily yield, keeping both mills running.

WHITE PINE.

REVIEW.—*News*, 14th: There is a greater desire on the part of mine owners on Treasure Hill to go to work, since the recent strikes in the Aurora South, Silver Wave and Silver Wedge. These continue to take ore from the large bodies recently struck. There are many mines that have large quantities of low-grade ore on their dumps, and could be turned to account if mills were owned in connection. The Consolidated Chloride Flat is working a number of men. Pinto, Kern, Robinson, Pierpont and a number of other outside districts will soon add to our bullion shipments. The base metal mines are to a great extent awaiting the completion of Governor Matteson's smelting and separating works. The Welch and Rathburn furnaces are running steadily on smelting ores—the former on ore from the Trench mine.

BULLION.—The shipment of base bullion for the week foots up 9,000 pounds. The shipment of fine bullion, \$32,234.02.

ITEMS.—Aurora South is still in that rich body recently struck, and shipping 40 to 50 tons daily to the Stanford mill. Adington is looking well. Several tons have been worked, producing \$300. We are informed that parties East are negotiating for this mine. Autumn No. 2 are in a streak of rich ore. Aurora Consolidated is taking out good rock. Bourbon, on Lower Chloride Flat, struck a body of good ore; 40 tons on the dump now being assorted. Chloride Flat Co. have a good force of men at work. Emigrant is being worked and several tons have been shipped. El Dorado and Black Cloud are in good ore. Gorilla—Have struck a seam of milling ore. Great Basin, on the Wabash, Hemlock and Glacier struck good ore in the Wabash and has 50 tons on dump. Iceberg South has good indications. Mammoth showing good. Has 50 tons of unsorted ore on dump. Original Hidden Treasure—Are in good ore; shipping 40 tons per day to two mills. Posthole worked under a lease. Red Rover still in rich ore. Silver Wave shipped 50 tons to mill last week. Silver Wedge—Are in a good body of first class ore. Of the base metal mines, Butler has a shaft down 34 feet; ledge almost perpendicular, from 10 to 20 inches in width, and in good ore. Assays \$120 to silver, and 40 per cent. in lead. Empress Josephine has a large force at work. Elko has a lot of first-class ore on dump. Erie mine in litigation. No work going on. Great Valley tunnel shows good ore. The shaft down 160 feet, shows good indications. Imperial Point—Work going on with encouraging prospects.

KERN DISTRICT.—*News*, 10th: We have been shown four assays from the St. Charles ledge, showing as low as \$302.68 and as high as \$5,011.03. There are about 30 miners in the district.

EUREKA BULLION.—The Elko *Independent* of 13th, says: Whitney & Co. have been shipping Eureka bullion the past three days, of which 41,502 pounds went east and 38,653 pounds to San Francisco. The bullion averages \$300 the ton in silver.

GOSHORE.—This, says the *News*, is the name of the ledge discovered by Owen Long, Julius Myer and others, 40 miles northeast of Sacramento District. Assays show \$172 the ton—of which \$35 is gold. A district has been organized under the name "Elk Mountain."

PROCHE.—Cor. of *News*, 13th: The new mill of the Meadow Valley Co. is turning out a fabulous amount of bullion. Mine is looking better, and producing richer ore, at a depth of 125 feet, than ever. The Creole is showing a large body of good ore. The parties holding a lease have upon the dump 300 tons of the best quality. The Meadow Valley Co. have upon the dump 2,500 tons, which they are moving to mill as rapidly as possible.

San Francisco Stock Market Review.

THURSDAY EVENING, August 18, 1870.

MISCELLANEOUS STOCKS.

Spring Valley Water Company stock has been in the market during the past week at \$68 per share. San Francisco Gas sold at \$88 50 @88. Twenty shares of California Steam Navigation Company stock realized 41½ @42 per cent. This Company disbursed its usual dividend on the 15th inst. The Central Railroad Company disbursed a ½ percent. dividend on the 15th. The California Powder Works paid a dividend of 1 per cent. on the 15th inst. The Bank of California disbursed its customary dividend of 1 per cent. per month on the 15th. The following named gentlemen have been elected Trustees and officers of the Pacific Rolling Mill Company for the ensuing year: Trustees—William Alvord, D. O. Mills, L. B. Benchley, A. Hayward, and B. P. Brunner; President, W. Alvord; Vice-President, L. B. Benchley; Superintendent, B. P. Brunner; Secretary, Samuel I. C. Swezey.

MINING SHARE MARKET.

The transactions at the Stock Board since our previous reference show quite a diminution in volume, but as a general thing prices have been well maintained, and in a number of instances exhibit an advance over opening rates of the week. The apathy at present prevailing in nearly all business circles has its effect in the direction of stocks, and, as a consequence, less business of a speculative nature is now transpiring.

CHOLLAR-POTOSI.—has been less active than during the previous week, but obtained better figures. For the week ending August 13th they extracted 1,656 tons of ore, the sample assay value being \$67 21 per ton; in previous week 1,700 tons were mined, giving an assay value of \$68 10 per ton. The ore-producing localities of this mine continue to promise well. They are now supplying half a dozen mills daily with from 250 to 300 tons of ore.

HALE AND NORCROSS.—has been well maintained. The yield of ore for the week ending August 13th amounted to 1,505 tons, 1,156 tons coming from the seventh level station. On the 535 level the south drift has reached the southern line, and they will now turn it east and carry it to the east vein—212 feet—thereby obtaining access to both veins and securing better ventilation. They have discontinued sinking the winze below the seventh level, owing to the increased flow of water. The developments made by this winze are reported to be very favorable.

GOULD AND CURRY.—sold to about the same extent as last week. For the week ending August 15th 288 tons of ore were extracted, that taken from the Potosi deposit showing an assay value of \$69 80 per ton. In the "raise" from the seventh station little has been done during the week. In the Potosi deposit, middle adit, they have made a raise of 41 feet from the top of the "schute" for air, and the face of the raise

is in ore of about the same quality as on the floor, showing that they have ore in that body to that height. A telegram of the 17th says: "Ore in raise fifteen feet wide."

KENTUCK.—light sales. During the week ending August 12th 245½ tons were mined, showing an assay value of \$2,914 95, or \$11 84 per ton. Most of the ore comes from the old west workings, about 80 feet from the surface. A small quantity is taken from the 700 level, but is all of low grade. Crown Point was more free of sale at a lower figure. For the week ending August 12th 361½ tons of ore were extracted, valued at \$4,495 36, or \$12 12 per ton. The station on the 1,100 level, at the incline, has just been completed. The incline is down and east from the 1,000 level 180 feet, or about nine feet below the 1,100 station.

SAVAGE.—was in the market to a large extent. For the week ending August 13th, 489 tons of ore were extracted, valued at \$10,269, or \$21 per ton, and is said to net a loss of \$177 in the aggregate, for production and reduction. Imperial reports that the west cross-cut still continues in porphyry and quartz; that the bottom of the shaft is in lively quartz, and that the winze fifty feet above is in good ore.

COGS BAY COAL M. Co.—Trustees: L. Stracas, O. Eldridge, J. W. Raymond, W. H. Sharp, C. Speckles, J. L. Pool and J. T. Dean.

EAGLE MINING DISTRICT.—An "Old Miner," who has been prospecting among the San Rafael mountains, some 30 miles north of Santa Barbara, writes favorably concerning the quicksilver claims of the Eagle Mining company, to the Santa Barbara Times. The situation of the mines, he says, is all that could be wished; abundance of wood and water, and a tunnel of three hundred feet will prospect the mine to the depth of four hundred feet; in many places the cropping of the mine is from forty to eighty feet above the surface of the ground, and varies from twenty to a hundred and fifty feet in width, and showing metal in nearly every part; the small veins can be traced several miles, and all concentrated into this grand out crop which certainly beats anything of the kind that I have ever seen. He speaks very enthusiastically of the prospects of the Eagle Quicksilver Mining Co. The officers of this company (Wm. H. Watson, President; Judge Townsend, Vice President; T. W. Colburn, Secretary; and J. Panir, Treasurer) are equally sanguine, as any one here can ascertain by calling at 26 Hayward's Building, 419 California Street.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

The Sunflower.

The sunflower, *helianthus annuus*, is generally regarded as a comparatively worthless plant, cultivated about cottages because the owners lack the taste or do not feel able to cultivate more pretentious plants to ornament their places. True, it is a somewhat coarse, rank growing annual; but it is neither unattractive nor useless. The sunflower is a native of South America, and was introduced into this country and Europe during the fifteenth century. Of late years its cultivation has been strongly recommended as a field crop, to be employed for economical purposes. The soil most suitable for its growth is that of a dry, friable nature, and if the ground is strongly impregnated with alkali, that fact is an advantage rather than otherwise. The economical uses of the plant and seed are numerous.

Years ago, the leaves of the sunflower were used as a substitute for tobacco, and were said to be especially useful for the asthma. They can be plucked off during the summer, without injury to the plant, and dried for fodder or fed green to stock of any kind. When fed green, they are said to greatly increase the flow of milk in milch cows, by whom they are eagerly devoured.

The stems may be made useful for bean poles or may be employed as supports for other climbing plants—the larger ones even for hops. When dried they form an excellent summer wood; fully as good as small willows, which are much sought after by bakers, from their furnishing a quick, hot blaze, with very little deposit of soot, much less than is the case with pine wood. In burning, the stems will yield ten per cent. of potash, a valuable product.

The seed, however, is the most important product. In some countries it is ground into flour, and used for bread or gruel. When simply "cracked," it furnishes a most excellent food for poultry, especially for young and growing chickens, or those which it is desirable to fatten for market. This fattening quality is due to the large amount of oil which they contain, but for that reason they should be fed only sparingly to laying hens. When roasted, the seeds have very much the flavour of coffee, and an infusion makes a very pleasant beverage.

The seed, on expression, furnishes a most excellent oil, which may be used as a salad oil, for the lamp or for the manufacture of soap. We saw a statement not long since, that a Mr. Schlicht, of Siskiyou, we think, is raising the sunflower on a large scale, and has put up an oil mill, by which he is manufacturing from this product an article of sweet oil, equal to anything of the kind in the market. He also makes a salad oil equal to the best made from the olive.

There is still another use not yet mentioned, and which, by no means, forms the smallest economic value of this hitherto neglected plant. We refer to the fact that it affords a most excellent bee pasturage. Indeed, the florets are said to be so full of nectar that the bees which visit them sometimes become clogged with the excess of sweetness, being not unfrequently so covered therewith, that their comrades are obliged to come to their relief. This peculiarity ought to give the plant a special value in some of the drier portions of the State, where bee food soon dies out; for by making a succession of plantings, which shall come into flower at the proper time, constant pasturage may be secured through the dry season, while the bee-keeper may go to any reasonable distance to find a convenient spot for his plantation.

The sunflower, like nearly all other vegetable productions, sometimes grows to enormous proportions in this State. Some three years ago, there was a mammoth sunflower exhibited at the *Bulletin* office, in this city, grown by Mr. E. T. Crane, of San Leandro, which measured four and a half feet in circumference or one and a half in diameter. This monstrous flower grew upon a stalk fifteen feet high, while its seeds were as large as ordinary grains of corn! Mr. Crane, we believe, planted several acres for the purpose of obtaining the seed for his poultry, and to shield an adjoining orchard from dust. Both objects were accomplished to his fullest satisfaction. The average growth of the plant and production of seed was enormous. After the young plants had become thoroughly rooted, they ran up at the rate of nearly two feet a week, or four inches a day!

An acre of land will contain 25,000 plants, when placed twelve inches distant from each other. The product will of course vary with the soil and mode of cultivation; but the average has been found to be about fifty bushels of seed, which will yield fifty gallons of oil and leave about 2,000 pounds of cake, as valuable as linseed oil cake, is worth, say \$30 in the market or \$50 for feeding. To this should be added the value of the stems and leaves as above.

Taking the above facts into consideration, we cannot but think the cultivation of the sunflower is deserving of far more attention than has usually been allotted to it. The varied and important uses to which it may be applied ought certainly to set people to thinking.

Selling Eggs by Weight.

It has long been urged, that eggs should be sold by weight, instead of by count. There can be no doubt that the great difference in size, a difference which is growing more and more marked by increased care in breeding, fully warrants the proposed change. *Twice a Week*, says that the average of a great number of hens' eggs, weighed at random from time to time, in the market, is two ounces, or 1½ pounds per dozen; but the difference in consequence of breed or feed and care makes the range from 1½ to 2½ ounces, so that if eggs are 45 cents per dozen the buyer would, on the average, pay 30 cents per pound, but by paying the same price per dozen and taking those larger or smaller than the average, he may get his eggs at 40 cents per pound or pay but 16½ cents per pound for them. For an article of as great consumption as eggs the difference is too great to be thought a trifle, and a little care will save many a dollar in the annual marketing outlay. Some people might think it small to stand and pick out eggs, but there is nothing wrong or little about it. In fact, it is the duty of every housekeeper to do so, and let it be once understood that either only the large eggs will be taken, or a less price paid for small ones, and dealers will find it necessary to sell by weight.

As to the difficulties in the new system, the *Poultry Bulletin*, which advocates the weight system, says "Fractions of a pound can be as easily calculated as meat, cheese or other commodities, the exact needed weight wanted, it is almost impossible to make, yet which are always sold by weight, and no difficulty found in the transaction."

A LADY FARMER.—Mrs. Millington, at the last meeting of the Royal Agricultural Society of Oxford, Eng., obtained the special prize of a five hundred dollar gold cup, for the best cultivated farm in that District. The prize was won against several very able and wealthy competitors.

ITALIAN CHESTNUTS are doing well in Santa Barbara as well as in Los Angeles. Judge Fernold, of the latter place, has one on his ground, but three years old, on which 23 nuts are growing! This tree is said to be a rapid grower, hardy and a very prolific bearer. It grows from seed and needs no grafting.

Grain Markets, as Affected by Seasons.

BY PROFESSOR ROWLANDSON.
[Concluded from last week.]

Speyning, Summer Drought, Rain, and Winds.

Severe vicissitudes from the end of February to May, rarely affect the wheat crop in England to any serious extent south of the Tweed. March frosts, however to the north of that river sometimes, though very seldom, occasion damage in the way already described; in the winter season, this portion of the kingdom being generally preserved from such evil effects by a covering of snow. During the month of May, wheat invariably assumes a yellow, sickly hue, a circumstance which for hundreds of years has been bruited almost every season, by real or pretended alarmists, as prognosticating a forthcoming deficient harvest. This sickly appearance arises from what is termed "speyning" Up to this period the wheat plant has obtained its support chiefly from the seed, and solely, through the medium of its seed roots. About this time a new set of roots is rapidly developed, just above the seed, at the point where the plant stools, and on the growth of which the future character of the plant almost wholly depends. The subsequent functions of the seed roots are thereafter of a mere nominal character. This singular habit of the wheat plant, which is confined exclusively to the cereals, was fully described and figured in the *Press* on page 46 of the present volume. This annual occurrence is so well known by the British farmers that it has given rise to the following doggerel quatrain.

"If you look at your wheat in May
You will come weeping away,
If you visit it again in June,
You will come away with a merry tune."

The character of the month of June exercises a most important influence on the harvest yield. Drought, such as is stated to have occurred during the month of June last is apt to occasion a dwarfed and spare appearance amongst wheat fields; but the yield in consequence rarely falls below an average, unless followed by an unfavorable—that is an extremely wet season. The most extraordinary summer drought known during the past century occurred in 1826, at which time in the Lake district where the annual rain fall averages from 75 to 150 inches, the crop of oats and barley were so stunted that neither sickle nor scythe could be employed to gather them, and the large majority of fields had to be hand pulled. On limestone and chalk uplands, cattle perished, as we have witnessed more than once in California under similar circumstances of drought. In the instance under notice, the rainless, or almost wholly rainless period, lasted from the commencement of June, until the end, July; yet the crop of wheat came up to an average as well as I can remember. Am obliged to make the last statement under limited conditions as I am without accurate data of grain prices beyond the year 1828. In the quarterly agricultural report for the market of that year, I find the following paragraph:

"The vast deficiency of these last (barley and oats) in 1826 produced an enormous foreign importation." As no reference is made in this report, to any importation of wheat, and as that grain, if of foreign growth, was not allowed at this period to be entered for consumption until the six weeks averages came up to 80s per quarter, or four dollars per 100 lbs, it is pretty evident that no foreign wheat was consumed in England, in consequence of the remarkable drought of 1826. In fact seasons of drought occurring during the early summer, have usually been succeeded by good wheat crops, and the instance cited goes far to show that in the severest cases, anything like a failure of crop, as a result need not be anticipated.

June is the flowering season, at which period the harvest yield may be seriously affected by either wind or rain; but more particularly by a combination of the two, which if long continued may affect the ultimate yield to the extent of from 25 to 50 per cent; as an extreme case, I may state one which I witnessed where a wheat field, from the combined influences named,

yielded little over twenty bushels per acre, which is a fair average year would have yielded eighty bushels. In the case observed in the year noticed (1829) heavy rains, accompanied by boisterous winds, blowing from all parts of the compass, prevailed during the flowering season, and destroyed the pollen. Usually however, a bad flowering season consists of pretty continuous wet weather, accompanied by almost equally continuous brisk, cold winds; the continuous effect of which are found to be as destructive to the pollen, as hurricanes or rains of a torrential character. From a bad flowering period, to harvest time, British corn markets are in a feverish condition; as the judgment of the most experienced observers are baffled in estimating the damage which has been so occasioned. The thrashing machine being the only safe test. In a generally extended bad flowering season however, the damage rarely falls below one fourth of the average crop. Neither prudence, skill nor judgment can guard or mitigate the effects of an unfavorable flowering season; all others, even to the destructive effects of the insect world, may in some measure be tempered; but no means exists of ameliorating the evils arising from an unfavorable flowering period.

A bad, that is a wet and cold ripening, and harvest time, frequently disappoints the hopes of the farmer, after his crop has successfully surmounted the risks of the prior season; the former causes the grain to be light, much only fit for tailings. The weight of flour to the weight of grain, as well as the quality, is also inferior, when compared with the produce of average years. By the adoption of my old acquaintance Alderman Mechi's proposal, a plan of drying crops by artificial means (and I have long believed the mode to be perfectly feasible and economical,) the dangers arising from a wet harvest, will be reduced to a minimum; in such an event, the great dangers to a British crop will, in a large measure, be reduced to two periods—the flowering and ripening seasons. The writer does not recollect any instance where a wet harvest has followed a May and June drought. To sum up in a few words, the chief danger to British harvests, will be found to consist in unfavorable flowering and gathering seasons.

BUTTER AND EGGS.—A lady of this city] but a "dairyman's daughter" sends us the following:

FOR PRESERVING BUTTER.—Take one gallon of water and add thereto salt until the water will bear up an egg; then add three tablespoonfuls of white sugar and one teaspoonful of saltpetre. Boil the solution five minutes and then allow it to stand until cold, when it should be strained into a bowl or other vessel. Pack into the same as much butter as the brine will cover.

TO PRESERVE EGGS.—Eggs may be kept good for a considerable time if packed in fine salt, and placed upon end. The eggs should be perfectly separated from one another and the upper layer completely covered. [An improvement on this would be to first inclose them in melted paraffine, so as to form a thin coating and so fill the pores of the shells as to render them air tight. The destruction of the egg is due to the entrance of the air from outside.—Eds. *Press*.] When packing for market they should be placed in boxes of oats, and always on end.

PALMS IN SAN JOSE.—In addition to other semi-tropical fruit, there are two fan and one date palm growing in the open air of the courtyard of Santa Clara College.

GOMA OIL.—The Japanese colony, at Placerville, has lately engaged in the cultivation of an oil-plant, of the nettle family, called Goma. The seeds of this plant are said to be so rich in oil that one hundred and thirty-six pounds of oil can be obtained from the product of an acre. The plant itself needs a great deal of moisture, which is to be supplied by means of irrigation. The young shoots form an excellent salad; the flowers are much sought after by bees; and the stems furnish a large amount of fibre. It is asserted that this goma oil, well prepared, is equal to the best olive oil, and does not become rancid so quickly, replacing the olive oil in all its technical applications. The price is expected to be considerably less than that of olive oil. We have clipped the above from one of our exchanges, the name of which we have inadvertently overlooked.

What I Know of Farming—No. 31.

The Farmer's Calling.

If any one fancies that he ever heard me flatter farmers as a class, or saying anything, which implied that they were more virtuous, upright, unselfish, or deserving, than other people, I am sure he must have misunderstood or that he now misrecollects me. I do not even join in the cant, which speaks of farmers as supporting everybody else—of farming as the only indispensable vocation. You may say if you will that mankind could not subsist if there were no tillers of the soil, but the same is true of house-builders, and of some other classes. A thoroughly good farmer is a useful, valuable citizen: so is a good merchant, doctor, or lawyer. It is not essential to the true nobility and genuine worth of the farmer's calling that any other should be assailed or disparaged.

Still, if one of my three sons had been spared to attain manhood, I should have advised him to try to make himself a good farmer; and this without any romantic or poetic notions of Agriculture as a pursuit. I know well, from personal though youthful experience, that the farmer's life is one of labor, anxiety, and care; that hail, and flood, and hurricane, and untimely frosts, over which he can exert no control, will often destroy in an hour the net results of months of his persistent, well-directed toil; that disease will sweep away his animals, in spite of the most judicious treatment, the most thoughtful providence, on his part; and that insects, blight, and rust, will often blast his well-grounded hopes of a generous harvest, when they seem on the very point of realization. I know that he is necessarily exposed, more than most other men, to the caprices and inclemencies of weather and climate; and that, if he begins responsible life without other means than those he finds in his own clear head and strong arms, with those of his belpmeot, he must expect to struggle through years of poverty, frugality, and resolute, persistent, industry, before he can reasonably hope to attain a position of independence, comfort, and comparative leisure. I know that much of his work is rugged, and some of it absolutely repulsive; I know that he will seem, even with unbroken good fortune, to be making money much more slowly than his neighbor, the merchant, the broker, or eloquent lawyer, who fills the general eye while he prospers, and, when he fails, sinks out of sight and is soon forgotten; and yet, I should have advised my sons to choose farming as their vocation, for these among other reasons;

I. There is no other business in which success is so nearly certain as in this. Of one hundred men who embark in trade, a careful observer reports that ninety-five fail; and, while I think this proportion too large, I am sure that a large majority do, and must fail, because competition is so eager and traffic so enormously overdone. If ten men endeavor to support their families by mere huckstering in a township which affords adequate business for but three, it is certain that a majority must fail, no matter how judicious their management or how frugal their living. But you may double the number of farmers in any agricultural county I ever traversed, without necessarily dooming one to failure, or even abridging his gains. If half the traders and professional men in this country were to betake themselves to farming to-morrow, they would not render the pursuit one whit less profitable, while they would largely increase the comfort and wealth of the entire community: and, while a good merchant, lawyer, or doctor, may be starved out of any township, simply because the work he could do well is already confided to others, I never yet heard of a temperate, industrious, intelligent, frugal, and energetic farmer who failed to make a living; or who, unless prostrated by disease or disabled by casualty, was precluded from securing a modest independence before age and decrepitude divested him of the ability to labor.

II. I regard farming as that vocation which conduces most directly and palpably to a reverence for Honesty and Truth. The young lawyer is often constrained, or at least tempted, by his necessities, to do the dirty professional work of a rascal intent on cheating his neighbor out of his righteous dues. The young doctor may be likewise incited to resort to a quackery he despises in order to secure instant bread; the unknown author is often impelled to write what will sell rather than what the public ought to buy; but the young farmer, acting as a farmer, must realize that his success depends upon his absolute verity and integrity. He deals directly with Nature, which never waxes and never will be cheated.

He has no temptation to sow beach sand for plaster, dockseed for clover, or stoop to any trick or juggalo whatever. "Whatsoever a man soweth that shall he also reap," while, true, in the long run, of all men, is instantly and palpably true as to him. When he, having grown his crop, shall attempt to sell it—in other words, when he ceases to be a farmer and becomes a trader—he may possibly be tempted into one of the many devious ways of rascality; but, so long as he is acting simply as a farmer, he can hardly be lured from the broad, straight highway of integrity and righteousness.

III. The farmer's calling seems to me that most conducive to thorough manliness of character. Nobody expects him to cringe, or smirk, or curry favor, in order to sell his produce. No merchant refuses to buy it because his politics are detested or his religious opinions heterodox. He may be a Mormon, a Rebel, a Millerite, or a Communist, yet his grain or his pork will sell for exactly what it is worth—not a fraction less or more than the price commanded by the kindred product of like quality and intrinsic value of his neighbor, whose opinions on all points are faultlessly orthodox and popular. On the other hand, the merchant, the lawyer, the doctor, especially if young and still struggling dubiously for a position, are continually tempted to sacrifice or suppress their profoundest convictions in deference to the vehement and often irrational prepossessions of the community, whose favor is to them the breath of life. "She will find that that won't go down here," was the comment of an old woman on a Mississippi steamboat, when told that the plain, deaf stranger, who seemed the focus of general interest, was Miss Martineau, the celebrated Unitarian; and in so saying she gave expression to a feeling which pervades and governs many if not most communities. I doubt whether the social intolerance of adverse opinions is more vehement anywhere else than throughout the larger portion of our own country. I have repeatedly been stung by the receipt of letters gravely informing me that my course and views on a current topic were adverse to public opinion: the writers evidently assuming as a matter of course, that I was a mere jumping-jack, who only needed to know what other people thought to insure my instant and abject conformity to their prejudices. Very often, in other days, I was favored with letters from indignant subscribers, who, dissenting from my views on some question, took this method of informing me that they should no longer take my journal—a superfluous trouble, which could only have meant dictation or insult, since they had only to refrain from renewing their subscriptions, and their TRIBUNE would at once come. Whenever they should have received what we owed them; and it would in no case stop till then. That a journalist was in any sense a public teacher—that he necessarily had convictions, and was not likely to suppress them, because they were not shared by others—in short, that his calling was other and higher than that of a waiter at a restaurant, expected to furnish whatever was called for, so long as the pay was forthcoming—these ex-subscribers had evidently not for one moment suspected. That such persons have little or no capacity to insult, is very true; and yet, a man is somewhat degraded in his own estimation by learning that his vocation is held in such low esteem by others. The true farmer is proudly aware that it is quite otherwise with his pursuit—that no one expects him to swallow any creed, support any party, or defer to any prejudice, as a condition precedent to the sale of his products. Hence, I feel that it is easier and more natural in this pursuit than in any other for a man to work for a living, and aspire to success and consideration, without sacrificing self-respect, compromising integrity, or ceasing to be essentially and thoroughly a gentleman.

HORACE GREELEY.

NEW CHERRIES IN OREGON.—Mr. Luelling, of Oregon, has recently originated a new seedling cherry which is said to present some most excellent points. It ripens late, and when fully ripe is almost black, its flesh is very firm, crisp and juicy, with a delicious flavor. It is very large—some specimens are said to have measured three and over three inches in circumference or an inch and one sixth in diameter. It does not bleed when the stem is removed, and is a prolific bearer. Its firmness renders it especially valuable for transportation. Some samples of this cherry were sent to New York, last summer, by steamer, and reached there in good condition. A box of

cherries were exhibited at the late meeting of the Pomological Society, at Portland, together with some branches of the tree with the fruit attached, which is represented as having been a grand sight. The fruit was pronounced by good judges, present the best they ever tasted. Mr. Luelling and others are engaged in propagating this tree, so that there is reason to believe that within a few years it will be common in our gardens. It should, by all means be named after its originator, rather than be called, as now, the "Black Republican."

Mr. J. W. Wellig, of Oswego, Oregon has also originated a new cherry which is described as "dark, rich, sweet and juicy, and of very large size." We are pleased to announce these valuable tributes of Oregon to the pomological world.

Oregon seems to be a natural home for the cherry, as it appears to flourish better than anywhere else on the Pacific Coast. The fruit of the eastern cherries is said to be quickly improved when grown there, and the crop never fails. Pomologists there hope to be able to produce many other and valuable varieties to send back to their Eastern friends, in return for the well known kinds which they have received from the East.

How Roots Grow and Feed.—No. 2.

In our remarks on the manner in which roots grow and feed, we have stated that the "root-hairs" are the mouths through which the plant feeds, while the leaves are its lungs. If we examine the roots of trees in the spring, especially roots of a pre-

vious year's growth, we shall find no rootlets, but in their place, innumerable little excrescences, each composed of many cells. From these cells new rootlets are produced, and from these new rootlets the root-hairs are thrown out, which are not true roots, any more than the leaves are true branches, and they never become roots, any more than leaves become branches. As the leaves extract nutriment from the atmosphere, so the root-hairs absorb it from the soil during the growing season. When their work for the season is done, they separate from the roots and decay in the soil, just as the leaves fall from the branches and decay on the surface. Root-hairs are also found on all the small roots which continue through the winter, the bark of which is not too spongy or scaly for their production. When the growth for the year is over, and the season of rest, or the winter, comes on, both the leaves and rootlets, as well as the root-hairs, are

thrown off, and the tree divested of all its clothing, both above and below ground, remains naked and unprotected through the frosts and bleak winds of winter; or through the resting season of deciduous trees, in semi-tropical climates.

The contact of the rootlets and root-hairs is very intimate. If we carefully lift a young plant from the earth, we shall notice that each rootlet is covered with an envelope of earth, which adheres with such tenacity that even a gentle shaking will not be sufficient to displace much of it. Fig. 1 represents a young wheat plant as taken up, and pretty strongly shaken. Each rootlet is separately enveloped, the earth being held in position by the root-hairs which cover them, as shown in the figure which we employed last week to represent the root-hairs upon a mustard plant, from which the soil had been carefully removed by the aid of water. The soil will be seen to adhere to Fig. 1, from the point where the roots start from the seed, down to near their tips, which are never covered with root-hairs, for reasons stated last week. Fig. 2 represents a single root of a wheat plant, with its branching rootlets, about one month older than the plant as represented in Fig. 2. In this instance it will be observed that not only are the root tips naked, as in figure 1; but the older parts of the root from the root-stem, nearly half the way down to the tip of the main root, are no longer enveloped with adhering soil. This arises from the fact that the root-hairs, on the older part of the root, have already begun to decay and drop off. Thus we see that while the root-hairs on deciduous or perennial plants continue to perform their office through the entire growing season, those on annuals have a very short life; beginning to decay very soon after the plant commences its growth, but being renewed by the newer portions of the root as it continues to push its way through the soil.

A knowledge of this latter fact leads to an important practical lesson, viz: that any disturbance of the newer roots of our annuals, such as wheat, corn, etc., should be carefully avoided; as it is upon that portion of its roots that the later growth of the plant depends. It is the newer parts of the root alone that are covered with active root-hairs; the upper or older portion being mainly employed as a conduit for conveying to the plant the food and moisture taken up by the newer portion.

Notices to Correspondents.

J. P. L., Port Wine, Sierra Co., Secretary Iowa M. Co., believes a steam pump is just the thing needed in those diggings. He wishes the address of parties manufacturing and selling steam pumps. San Francisco dealers ought to advertise. Send circulars as above.

Sixteen Pages Extra.

We shall print a THIRTY-TWO PAGE EDITION, September 3d, containing the paper, already announced, entitled: "A Guide to California Immigrants." Its publication has been delayed partly on account of the printers' strike, which came to a sudden end, with a reduction of prices.

DIAMONDS.—An article (to be found on another page of this issue) on the probability of the occurrence of diamonds in California, by Mr. Henry G. Hanks, is worthy the attention of miners.

PROF. HENRY DURANT, just elected President of the State University, is a gentleman of thorough education, and his efforts towards the progress of the Colleges of California, during a long time, have not been excelled by any others. He is also a person of liberal spirit and geniality, and among the best citizens of Oakland, and to whom he is most familiar, his election is exceedingly popular, and is considered a fortunate result.

PERSONAL.—We were much pleased, on Tuesday last by the appearance in our office of Father Chichi, formerly of the St. Ignatus College, but more lately connected with the Georgetown College, at Georgetown, D. C. We understand that he has again returned to this State to resume his connection with the College at Santa Clara.

DESTRUCTIVE FIRE AT NEW ALMADEN.—On August 15th, at 2 A. M. a fire broke out in a bakery in the town on the hill at the New Almaden mines. There were no means of extinguishing the flames, which spread until nearly the whole town was burnt down. The people, roused from their sleep, had barely time to save themselves, without being able to save any of their effects. Many are reported to be left entirely destitute.

Smelting at Eureka, Nevada.

BY GUIDO KUSTEL.

At present, the smelting of argentiferous lead ores at Eureka is conducted in six furnaces, belonging to different parties. Other furnaces are in the course of construction.

These furnaces are all built after the same general pattern and vary but little. They are vertical blast or cupola furnaces with a square horizontal section. The blast is admitted through three tuyeres, one at the back and one on each side. The mouth or nozzle of the tuyeres is generally three inches in diameter, admitting a very large amount of wind—too much, considering the horizontal dimensions of the furnaces, which are about two feet square, and the easy fusibility of the ore. The shaft is from 12 to 16 feet high, from the tuyeres to the charging hole. The hearth is about two feet below the tuyeres, and is made of stone, the front part alone being formed of a composition. At the bottom of the hearth is the tap-hole, through which the

lead is run out at intervals. One tapping gives about 200 pounds of pig lead, which, being run into moulds, forms bars weighing from 80 to 120 pounds apiece.

The furnace is built of stone found here, lined inside with a fire-proof sandstone, which is found at Pancake mountain, about twenty miles distant. This last is porous and of an excellent quality. Lately, sandstone equally as good has been found at Eureka. The blast is furnished by fan blowers. The illustration shows the common style of furnace used. Here A denotes the walls, built of a sort of porphyry tufa; B, the inside lining of sandstone; C, the front of the hearth, of composition. The shaft, D, has a square horizontal section, and the shaft, O, a circular one. I is the charging hole.

The ore is principally cerussite or carbonate of lead. There is also some galena, but only in limited quantities at present, and mostly changed into a dull, black mineral, retaining the structure of galena, and apparently unchanged in the center. Singularly enough, the dull portion is richer in silver than the galena, from which it seems evidently to have been formed, perhaps by the influence of internal heat. It resembles Stetefeldtite. On an average, the ore prepared for smelting contains 40 to 45 per cent. of lead, \$60 to \$80 in silver, and \$15 to \$20 in gold per ton. In bulk, the ore has a yellow color, due to the iron

in it. There is also arsenic in the ore, which, in smelting, combines with the iron, forming a white compound (speise), somewhat like mntt, and holding \$36 to \$45 per ton in silver and gold, and 24 per cent. of lead. The ore smelts readily by itself, nothing being added except about 20 per cent. of slag.

Analysis of the slag shows the following composition. For the sake of comparison, the composition of a Freiberg slag is also given. No. 1 is the slag from Eureka, and No. 2 that from Freiberg:

	No. 1.	No. 2.	
Silica.....	30.20	36.50	
Iron (suboxide).....	50.60	40.50	To form this requires
Alumina.....	3.01	8.50	2,660° Fahr., and to
Lime.....	7.10	4.00	melt it when formed.
Magnesia.....	0.10	3.00	2,402°.
Lead (oxide).....	8.70	7.50	
	100.51	100.00	

There is a little too much iron in the slag No. 1. For the protection of the furnace lining a somewhat larger proportion of quartz in the ore would seem to be advantageous. Yet as it is, there is a most fortunate coincidence of all the requirements for easily smelting the Eureka ore.

About 24 pounds of charcoal are charged into the furnace at one time, and from 40 to 45 pounds of ore, besides 12 pounds of slag. But the charging is done in a very irregular manner, by means of shovels and without weighing or measuring. One furnace can smelt from eight to nine tons of ore in 24 hours. Three and a half tons of ore yield about one ton of pig lead, or "bullion," as they prefer to call it. The consumption of charcoal varies from 30 to 35 bushels to the ton of ore. At present, it costs about \$20 to smelt a ton of ore; it is probable, however, that, by using a furnace of larger capacity, the expenses may be reduced to \$14 or \$15.

When the furnaces are properly managed, the loss of lead will probably not exceed 20 per cent. At present, however, it is larger, owing to several reasons, and very largely to the very frequent use of crowbars about the hearth, whereby a great deal of lead is mixed in with the slag. By using such large tuyeres, it would seem that too much wind was brought into the furnace, and without sufficient pressure. Hence the heat is not concentrated in the smelting region just above the tuyeres, but is diffused in the upper part of the furnace, and the carbonate of lead commences to melt at a distance of one or two feet below the charging hole, and the lead is thus exposed a long time to volatilizing influences. Hence, also, in the hearth the temperature is too low, the slag stiffens, sticks to the walls, makes the constant use of the crowbar necessary and takes up mechanically considerable lead. Again, the ambition of having a very long run induces some smelters to keep the furnace at work when it evidently needs repairs, and this is another source of loss of lead and silver.

The amount of speise (the combination of arsenic and iron) is about three per cent. of that of the ore. At present this is not treated further.

The bullion contains, on the average, about \$170 in silver and \$80 in gold, or a total of \$250 per ton. This statement must be taken, of course, as a very general one. The lead is at present shipped to Newark, N. J., for the purpose of extracting the silver and gold. There is nothing to prevent its being cupelled at Eureka, but different circumstances induce the companies to send it away.

A large furnace, with five tuyeres, and capable of smelting 24 tons in 24 hours, is now being built by the Eureka Smelting Company, under the superintendence of Mr. Ch. V. Liebenau. This furnace will be six-sided, and in the middle of each side, except the front one, comes a tuiere directed towards the centre of the furnace. The diameter of the furnace, or rather the distance of the centers of opposite sides, is three and a half feet at the level of the tuyeres, and four feet at the level of the feeding hole. From the tuyeres to the feeding hole is 16 feet. The furnace will cost between \$2,500 and \$3,000.

Wire Tramway at White Pine.

We learn that the English company at White Pine are about to put up a wire tramway from their mines, on Treasure Hill, to their mills. The system to be introduced is that of Mr. Hodgson, an English engineer, which is in use in England, Ireland, France and Hungary, and of which a specimen line (portion of a line, 60 miles long, to be erected at Ceylon), has lately been set up at Brighton, England, so as to afford a crucial test of the capabilities of the method.

This system consists of an endless wire rope running over a series of pulleys carried by posts, which are ordinarily placed about 200 feet apart, but which at Brighton vary in distance up to 900 feet. This rope passes at one end of the line around a drum, driven by any sufficient power, at a rate of 4 to 8 miles per hour. The box which carries the load is attached to a box-head (which travels with the rope) by means of a curved arm or pendant, which maintains the box in equilibrium and enables it to pass the supporting posts and pulleys.

The box-head consists of an oak block, about 14 inches long, lined with leather, and cut out on its under side into a A-shape, so as to catch over and grip on the rope. It has, moreover, four small wheels, which run on rails placed on each support, and thus lift the box-head at these points from the rope and enable it to pass the pulleys, the momentum acquired keeping the load in motion until the box-head again catches the rope beyond the pulley.

The boxes can be made to carry from 1 cwt. to 10 cwt. On the five-mile line at Brighton the rope is thought to be capable of delivering 120 tons each way in a day of 10 hours. This rope is of charcoal iron, is two inches in circumference and presents gradients in some parts as steep as 1 in 8. The power employed is a 16-horse power engine. There are two curves where the line turns at right angles, besides having several lesser angles, and the surface of the country is very irregular and broken, being chosen on this account. The rope is driven at a uniform rate of 5 miles an hour.

The tests at Brighton seem to have been sufficiently successful to attract quite a general attention to the system. We are glad that now it is to be tried in our country. We need anything of the kind which will lessen the expenses of transportation, and this method seems to promise well in this direction. It may also admit of a wider application than originally intended. Perhaps it may be used for passenger traffic, although this is very doubtful in our opinion. But the 60-mile line at Ceylon will be an important experiment. This line, we ought to state, will be divided up into five-mile sections, similar to the one at Brighton. We ought also to state that the lines now in operation are said to give good satisfaction and that there are, in addition, lines in construction in Peru, New Zealand, Brazil, Italy, Spain and Sweden, with new constructions in France and England.

ANOTHER.—A new paper, the *Rural Californian*, edited by M. J. Kelly, is to be published at Sacramento. It is to be devoted to the agricultural interest and, in addition, to contain considerable reading matter for the home circle. It is promised that no pains will be spared to bring it up to the highest standard. If the managers fulfil their promise, no one will be more ready to wish them success than the SCIENTIFIC PRESS.

REDUCTION WORKS OF OAKLAND.—The City Council have passed an ordinance prohibiting the erection of the smelting works for sanitary reasons. Whether this will result in deterring the company from continuing their operations, is doubted by some. Probably no immediate steps will be taken.

Air Target Pistol.

There is a peculiar fascination about shooting, which attracts both sexes and all ages of mankind. Although the "dreadful noise" is a great drawback to the more general indulgence in this pastime by the fairer and gentler sex, yet many have accustomed themselves to hold a pistol, or even a gun, occasionally. Since air-guns have come into vogue, practice with them is said, indeed, to have become a standard amusement at pleasure resorts and water-lag places.

To indulge, however, in the use of an article which costs from twenty to sixty dollars, as has been the case with air-guns and pistols hitherto constructed, is expensive enough to deter many from participating in the amusement. Mr. Hawley has therefore constructed a pistol, the one here illustrated, which costs only three and a half dollars, and is said to be the cheapest air pistol ever made.

The stock is of japanned iron and the barrels are of brass. The upper barrel holds the missile, and the lower one is the air-pump which fills the stock with compressed air. The dart is placed in the rear end of the upper barrel, and over the space shown is drawn a ring slide, forming an air-tight chamber. The hammer strikes the nipple, which opens a valve in the passage from the air-chamber in the stock to the upper barrel, allowing just enough air for one charge to escape. Five to ten shots may be fired before it is necessary to re-charge the air-chamber. The range is from thirty to fifty feet.

Darts are furnished with each pistol, and every piece is tested before leaving the factory. The patentee is E. H. Hawley. For pistols address P. C. Godfrey, 119 Nassau street, New York. Agents are wanted.

State University.

A meeting of the Board of Regents was held on Tuesday last, Gov. Haight presiding. Prof. Gilman having declined the Presidency of the University, another choice was necessary. On the first ballot, Mr. Henry Durant, of Oakland, was elected, there being but two names in nomination, and none of the Eastern gentlemen, recommended by various parties and candidates at the last election, being mentioned.

The Library Committee reported that Mr. F. Bret Harte had been appointed Professor of Recent Literature and Curator of the Library and Museum, with a salary of \$3,600 per annum. The purchase of the valuable library of Dr. A. S. Taylor, of Santa Barbara, was recommended. Mr. W. C. Ralston donates to the library two large, illustrated volumes of the "History of the University of Oxford."

Matters relating to the Mechanic Arts College and the Toland Medical College were referred to the proper committee. The Committee on Instruction were directed to report on the proper steps to be taken for establishing free competition scholarships.

COMPLETED.—The Kansas Pacific Railroad is completed to Denver. On the morning of the 15th, 10½ miles still remained unfinished. A flag was placed in the center and two parties, under E. W. Wood, and J. W. Eicholtz, working from the east and west, had a race to reach the flag. Wood's party came in ahead at 12½ P. M. The last rail was down at 2½ P. M.

Agricultural Notes.

REPORTS from the upper portions of the State are still more favorable than ever for the crops in that region. The cabbage crop of Plumas, however, has been much injured by lice, so much so that it is

E. H. HAWLEY'S PATENT AIR TARGET PISTOL.

thought the people of that county will have to take their corned beef straight next winter.

OIL FACTORY.—A new oil factory is about being built at Alameda Point by a Mr. Orr, which will manufacture oil from the *kakui* nut, an invoice of which will soon be here from the Sandwich Islands. This nut, which grows in great profusion on the Northern and Southern Pacific Islands, is exceedingly oleaginous, and can be reduced at very small cost. It yields the nut oil of commerce, and is held in high favor for lubricating purposes. It might, no doubt, be raised in California. Mr. Orr will also, after he gets fairly under

the mitrailleuse have been given for the sake of general effect rather than as the result of actual experience. We add a cut this week which shows the arm ready for transportation. By two men, one at each end, it can be readily carried to almost any desired spot. The cut likewise shows the relative position of the barrels.

ADMIRAL FARRAOUT is dead. A sailor from his earliest youth, he escaped the mediocrity which too often falls to the lot of those who commence an occupation so young and without previous education, and growing always with his years, finally attained the highest position in our navy.

The Mitrailleuse in Position for Carrying.

way, turn his attention to the manufacture of castor, linseed and table oils. This establishment, we believe, will make the fourth or fifth of its class on the Pacific Coast, one of which is at Salem, Oregon, and which expects to work up 30,000 bushels of flax seed this season.

LARGE ONION.—The Butte Record has seen an onion grown in one of the Oroville gardens whose weight is 2½ pounds, and which measures 18 inches in circumference. It is a huge specimen of the *genus allium*.

THE STANDISH STEAM PLOW, constructed at South Boston, under Mr. Standish's personal superintendence, has been tried with success. A slight modification in its feed, being the only thing necessary to make it entirely satisfactory. Some Louisiana people are looking upon this first improved machine with covetous eyes, but we hope it will soon come to California. Mr. Chas. Coffin of Boston, agent for the proprietors, is here on a short visit, and we trust he will be induced to bring the plow here to commence with, as previously anticipated. Its success will add greatly to the value of an immense amount of California lands.

ROAD ENGINE FOR CALIFORNIA.—One of Thompson's improved rubber tire road engines, for steam plowing and other agricultural purposes, is expected here from London in a few weeks, for Mr. George D. Roberts and his associates in the Tule Land Reclamation Co.

THE Marshall tunnel, at Georgetown, Colorado, has been driven 750 feet in the mountain. It is 7 feet high and 8 feet wide. It has cut four lodges.

The Mitrailleuse.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING AUGUST 9th.

AUTOMATICALLY-OPERATED WATER-CLOSET-SEATS.—Perry W. Davis, Portland, Oregon.

DEVICE FOR PACKING BOTTLES.—George C. Fisher, Yreka, Cal.

MACHINE FOR THE MANUFACTURE OF COMPOSITION PIPES FOR DRAINAGE.—Robert Skinner and Richard Gaines, San Francisco, Cal; said Gaines, assignor to said Skinner.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The New Patent Act.

AN ACT TO REVISE, CONSOLIDATE AND AMEND THE STATUTES RELATING TO PATENTS AND COPYRIGHTS.

APPROVED, JULY 8, 1870.

[CONTINUED FROM PAGE 113.]

SEC. 25. And be it further enacted, That no person shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid by reason of its having been first patented or caused to be patented in a foreign country; provided the same shall not have been introduced into the public use in the United States for more than two years prior to the application, and that the patent shall expire at the same time with the foreign patent, or, if there be more than one, at the same time with the one having the longest term; but in no case shall it be in force more than seventeen years.

SEC. 26. And be it further enacted, That before any inventor, discoverer shall receive a patent for his invention or discovery, he shall make application thereof, in writing, to the Commissioner, and shall file in the Patent Office a written description of the same, and of the manner and process of making, constructing, compounding, and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, compound, and use the same; and in case of a machine, he shall explain the principle thereof, and the best mode in which he has contemplated applying that principle so as to distinguish it from other inventions; and he shall particularly point out and distinctly claim the part, improvement, or combination which he claims as his invention or discovery; and said specifications and claim shall be signed by the inventor and attested by two witnesses.

SEC. 27. And be it further enacted, That when the nature of the case admits of drawings, the applicant shall furnish one copy signed by the inventor or his attorney in fact, and attested by two witnesses, which shall be filed in the Patent Office; and a copy of said drawings to be furnished by the Patent Office, shall be attached to the patent as part of the specifications.

SEC. 28. And be it further enacted, That when the invention or discovery is of a composition of matter, the applicant, if required by the Commissioner, shall furnish specimens of ingredients and of the composition, sufficient in quantity for the purpose of experiment.

SEC. 29. And be it further enacted, That in all cases which admit of representation by model, the applicant, if required by the Commissioner, shall furnish one or convenient size to exhibit advantageously, the several parts of his invention or discovery.

SEC. 30. And be it further enacted, That the applicant shall make oath or affirmation that he does verily believe himself to be the original and first inventor or discoverer of the art, machine, manufacture, composition, or improvement for which he seeks a patent; that he does so know and does not believe that the same was ever before known or used; and shall state of what country he is a citizen. And said oath or affirmation may be made before any person in the United States authorized by law to administer oaths, or when the applicant resides in a foreign country, before any minister, charge d'affaires, consul, commercial agent, holding commission under the United States, or before any notary public of the foreign country in which the applicant may be.

SEC. 31. And be it further enacted, That on filing of any such application and the payment of the duty required by law, the Commissioner shall cause an examination to be made of the alleged new invention or discovery; and if on such examination it shall appear that the claimant is justly entitled to a patent under the law, and that the same is sufficiently useful and important, the Commissioner shall issue a patent therefor.

SEC. 32. And be it further enacted, That all applications for patents shall be completed and prepared for examination within two years after the filing of the petition, and in default thereof, or upon failure of the applicant to prosecute the same within two years after any action therein, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner that such delay was unavoidable.

SEC. 33. And be it further enacted, That patents may be granted and issued or reissued to the assignee of the inventor, or discoverer, the assignment thereof being first entered of record in the Patent Office; but in such case the applicant, in for the inventor or discoverer; and also if he be living, in case of an application for reissue.

SEC. 34. And be it further enacted, That when any person, having made any new invention or discovery for which a patent might have been granted, dies before patent is granted, the right of applying for and obtaining the patent shall devolve upon his executor or administrator, in trust for the heirs-at-law of the deceased, in case he shall have died intestate; or if he shall have left a will, disposing of the same, then in trust for his devisees, as in full manner and on the same terms and conditions as the same might have been claimed or enjoyed by him in his lifetime; and when the application shall be made by such legal representatives, the oath or affirmation required to be made shall be so varied in form that it can be made by them.

San Francisco. Orders by express promptly attended to.

CALIFORNIA-MADE
FARM WAGONS
FOR SALE.

We still continue to have manufactured in this city
and vicinity a large number of these Wagons, made gen-
erally for two horses, Light, Medium-size, and Heavy,
with either Iron Axles or Thimble Skins—thus EN-
COURAGING HOME INDUSTRY, and demonstrating to
the satisfaction of every intelligent observer the superi-
ority of California-made Wagons, both as to style,
materials and workmanship, over any Wagons sent here
for sale, whether made at the State Prison, Jackson
(Mich.), or at South Bend (Ind.), or any other Western
place, while our prices are very much lower.
Of every description of vehicles now running in Cali-
fornia, probably ninety-nine out of every hundred have
been made in this State, and their superiority in stand-
ing well in this dry climate has been so well established
throughout the past twenty years that it would, in the
mind of any FAIR DEALER, seem to be an improper re-
flection upon our many skillful mechanics in this
branch of business, to say otherwise.
We are prepared to furnish any reasonable number of
these Wagons on short notice.
Catalogues and price lists sent on application.
Persons wishing to purchase visitors to the city, and
all who may feel any interest in the matter, are re-
spectfully invited to CALL, EXAMINE and COMARE.

MEEKER, JAMES & CO.,
—IMPORTERS OF—
CARRIAGE AND WAGON MATERIALS,

NATURE'S PRESCRIPTION.—When Nature produces a
great remedy for disease, the best thing science can do
is to follow her prescription. By separating the water of
the famous Seltzer Spring into its elements, science
has discovered the means by which that world-renowned
Sps affects such unparalleled cures, and by combining
those elements artificially in TARRANT'S EFFERVESCENT
APERIENT, the grand prescription of Nature is rendered
universally and instantly available. At this season
when fevers, disorders of the stomach, bowels, bilious
complaints, and all the diseases which effect the diges-
tive, assimilating and secretory organs are especially
prevalent, the importance of having this invaluable al-
terative and corrective at hand in every home, and
within reach of all who travel by land or water, cannot
be over-estimated.
SOLD BY ALL DRUGGISTS.

The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

**SPORTING,
MINING,
And BLASTING
POWDER,**

OF SUPERIOR QUALITY. FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the most blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

DEWEY & CO.,
No. 414 Clay street, S. F.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 24, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "a little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the Mucous Membranes.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and

FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;

FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread;

FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,

FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

**DR. FURBER'S CORDIAL
OF
MOUNTAIN BALM
—AND—
OREGON GRAPE,**

Two Plants, abounding on the base of, and on the Mountains surrounding

MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$3 greenback, and directing that the package should be sent by WELLS, FAROE & Co's EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-12v17

PACIFIC BUSINESS COLLEGE,

Mechanics' Institute, 27 Post Street,

BET. MONTGOMERY AND KEARNY, SAN FRANCISCO.

THE PIONEER AND ONLY BUSINESS COLLEGE

On the Pacific Coast where BOOK-KEEPING is taught as practiced in the Counting-room. **PENMANSHIP.**

In this useful and very important branch we challenge competition.

PROF. SERENI

Has obtained First Premiums at all the Fairs on this coast where his Penmanship was exhibited, and was awarded the MEDAL at the Seventh Industrial Exhibition of the Mechanics' Institute in 1869 over all competitors. His success as a Teacher is unequalled.

TELEGRAPHING.

The only place in the city where Telegraphing is taught by an experienced Operator.

We cordially invite the public to call and examine the merits of the College. Our Institute is patronized by the youth of fifteen and the man of fifty, where they receive instruction in Single and Double Entry Book-Keeping, Commercial Arithmetic, Commission Jobbing, Business and Ornamental Penmanship, Commercial Correspondence, Actual Business, Merchandising, Banking, Importing Railroad, Steamboating, Mining, Real Estate, Brokerage and Exchange, Mechanical and Architectural Drawing, Telegraphy, Orthography, French, Spanish, Italian, German and English Grammar. No CLASS SYSTEM. Each student receives individual instruction. No Vacations.

DESIGNS AND PLANS

—FOR THE—

NEW CITY HALL

—OF—

SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast corner of Sacramento and Montgomery streets, San Francisco, June 22, 1870.

The Board of City Hall Commissioners hereby give notice that they will be prepared to receive at their office, on or before the FIRST DAY OF NOVEMBER NEXT, designs and plans for the new City Hall of San Francisco.

The Commissioners, in order to obtain the very best design and plan, invite the fullest competition among architects, and to this end have resolved to offer the following premiums:

First—For the design and plan selected and adopted\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500

The premiums payable in City Hall warrants.

As a guide to architects in the preparation of the designs and plans, the Commissioners have prepared a pamphlet containing full instructions and suggestions, as well as the terms and conditions upon which the premiums will be awarded.

Pamphlets can be had on application at the office of the Commissioners.

Any design or plan in which the requirements of the Board, as set forth in the printed instructions, have not been reasonably complied with, will be rejected from the competition.

P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

BOOK ON EARTHQUAKES.—A Treatise on Earthquake Dangers, Causes and Palliatives, by Prof. Thomas Rowlandson, comprising Earthquake Dynamics, Earthquake Waves, Sound that attends Shocks, Lime, Mortar, etc., Cosmogony and Seismogony, Phenomena of the Neapolitan Earthquake of 1857, and General Observations respecting Structural Arrangements. Published by Dewey & Co., Scientific Press Office, San Francisco, 1869, containing 96 pages. Price, 50 cents; postage free.

LATRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

THE SCIENTIFIC PRESS now stands at the head of such papers on this coast, and is for miners, mechanics, and farmers, a most valuable journal. It is a 16 page journal, contains the latest and most reliable news from every mining section of the Pacific; gives full descriptions with engravings of every new and valuable mechanical invention, devotes considerable space to the agricultural, horticultural, and florist, and keeps its readers well posted on all the facts and improvements in the arts and sciences. Mr. M. is canvassing this Territory for subscribers at four dollars per annum, and we cordially recommend the SCIENTIFIC PRESS to our citizens and welcome it to our exchange list.—*Boise City Chronicle.*

Mining and Company Advt's.

Eagle Quicksilver Mining Co.—Location of Works: Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of July, 1870, an assessment of twenty dollars (\$20) per share was levied upon the mines of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, room No. 26, Haywood's Building, No. 419 California street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Monday, the 19th day of September, 1870, shall be deemed delinquent, and will be duly advertised on September 24th, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.
Office, Room No. 26, Haywood's Building, 419 California St., San Francisco, California. jy30.

PAIN KILLER

PROF.

DAVIS & SON, PROVIDENCE, R. I.

1840 1870

The Great Family Medicine of the Age.—THIRTY YEARS have elapsed since the introduction of the PAIN KILLER to the public, and yet at the present time it is more popular and commands a larger sale than ever before. Its popularity is not confined to this country alone; all over the world its beneficial effects in curing the "ills that flesh is heir to," are acknowledged and appreciated, and as a PAIN KILLER its fame is limited to no country, sect nor race. It needs only to be known to be prized. Thirty Years is certainly a long enough time to prove the efficacy of any medicine, and that the PAIN KILLER is deserving of all its proprietors' claim for it is amply proved by the unparalleled popularity it has attained. It is a sure and effective remedy. Sold by all Druggists. Price 25 cents, 50 cents, and \$1 per bottle.

Directions accompany each bottle.

4-v21-1m

DR. ABORN

Has Consented to Remain on the Pacific Coast a while longer.

He can be consulted until the 10th of September, as follows: At the Auzeiras House, San Jose, from the 1st to the 31st of July; at 22 Kearny street, San Francisco, from the 1st to the 5th of August; at the Yosemite House, Stockton, from the 6th to the 31st of August; and again at 22 Kearny street, San Francisco, from the 1st to the 10th of September.

Card from Wm. Hoskins, Notary Public, Oakland.

Dr. Aborn.—I take pleasure in bearing testimony to your skill and treatment for Catarrh and Bronchial Affection, having been under your treatment the past ten weeks, and find myself nearly cured. As you are about leaving for San Jose, I cheerfully recommend you to all similarly afflicted.

Oakland, June 3, 1870.

WM. HOSKINS.

No Painful Operations.

Dr. Aborn does not subject his patients to any painful or unpleasant operations. His treatment is mild, and safe for the most delicate child. The afflicted are hereby informed, that after the first visit, for many of the diseases which he cures, especially, they can take the treatment home and use it until cured, without pain or interruption to their usual avocations.

Prominent Californians.

Hon. James A. Johnson, M. C., Lieut. Governor Holden, Charles N. Fox, Esq., S. O. Loughton, Esq., Gen. E. F. Beale, Melville Cottle, Esq., Wm. Hoskins, Esq., Messrs. Wm. B. Cooke, H. M. Jones, Henry Orman, Jr., J. H. Hardwick, Perry Dyer, J. S. Carter, Hubert Burgess, and many other prominent citizens of California, have willingly given their cards to the public, testifying to the efficacy of Dr. Aborn's treatment. Many cures have been effected by the Doctor within a few days, and a number of those cures were of many years standing, and had resisted all the ordinary modes of treatment. The usual success attending Dr. Aborn's treatment should inspire new hope of speedy recovery even in the most hopeless cases.

THE large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of DEWEY & Co., publishers of the SCIENTIFIC PRESS. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

THE GRAND

Horticultural, Agricultural and Pomological

EXHIBITION

OF THE

MECHANICS' INSTITUTE,

Will open on MONDAY, AUGUST 29, 1870, and continue for FIVE DAYS, at the

Pavilion Building,

On Union Square, San Francisco.

The Exhibition will be of FRUIT, FLOWERS, PLANTS, CEREALS, WINES, FERNS, SHRUBS, VEGETABLES, And all that relates to the Flora of California. Every facility will be extended to Exhibitors, and CASH PREMIUMS To the amount Two Thousand Dollars Will be awarded to Competitors in the Products of the Soil.

THE SOCIETY'S Gold Medal will be awarded for CALIFORNIA WINES. THE PAVILION will be appropriately decorated, and in the evening, in addition to the Floral and Pomological display, there will be Music by the best attainable FULL BAND, and Instrumental Solos. The Exhibition will be visited by many of the representatives of the leading Horticultural and Agricultural journals of the Eastern States, now on a visit to California to inspect its Fruits, Flowers and Agricultural resources. ADVISORY COMMITTEE: DR. EZRA CARR, Professor of Agriculture and Horticulture, State University. S. W. SHAW, President Fruit Growers' Association. J. S. HITTLE, Author Resources of California. E. J. WEEKS, President Bay Dist. Ag. Society. J. L. SANFORD, Napa. Mr. HASKELL, Marysville. A. J. MOULDER, Secy. Board of Regents. It is intended that this Exhibition shall be the feature of the season, and everything will be done to make it an agreeable and attractive entertainment to the visitor.

ADMISSION: Double Season Tickets, (Gentleman and Lady) \$2 50 Single Season Tickets..... 1 50 Single Admission..... 50 Children..... Half Price. Season Tickets can be obtained of any member of the Board of Managers, at the Mechanics' Institute Library, 27 Post Street, or at any of the Book or Drug Stores. All communications desiring information, or applications for space, must be addressed to H. C. KIBBE, Corresponding Secretary Mechanics' Institute, who will forward Premium List, Rules, etc.; or application can be made at the Library of the Mechanics' Institute, 27 Post street. Per order Board of Managers. A. S. HALLIDIE, President. GEORGE PARDEY, Secretary.

Delivered in the city, per month, 50 cents. Office, Old Fellows' Hall, 327 Montgomery street, San Francisco. 19v19

Machinery.

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an obvious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,

Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864, July 21, 1866, and Oct. 9, 1866.

ADAPTED

FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

16v16-1y

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivalled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont street, San Francisco.

THE SCIENTIFIC PRESS is a valuable journal for all persons engaged in matters connected with practical industry where science or machinery are needed.—Colorado Herald.

CLAY'S STEAM COOKER.
(PATENTED NOV. 23, 1869.)

A cheap, simple and practical invention that can be used with any Cooking Stove and the following advantages gained:
1st. It saves twenty five per cent in time and fuel over the ordinary method of cooking. 2d. It prevents the possibility of scorching, or burning food, while it is being cooked. 3d. No heavy, smutty, greasy pots and kettles are to be handled and cleaned; but light tin dishes that come out of the Cooker, with nothing but drops of clean water on them. 4th. No odors can escape to fill the house, and attract the flies, and the flavor and nutriment are perfectly steamed, rendering the victuals more palatable and healthy than when prepared in the ordinary way. 5th. It can be used alone over a gas burner, or camp fire, and the food when cooked, keeps warm almost indefinitely. Mr. H. L. Southworth, Proprietor of the National Hotel at Salt Lake City, who has been using one for some time says: "I predict for it an entrance into the palace of the wealthy, the cottage of the peasant, the camp of the miner and the tent of the soldier, or wherever intelligence shall seek to take advantage of the improvements of the age." A complete working model can be seen at our office, and any person wishing to buy a County or State Right, can have the satisfaction of thoroughly testing its merits before investing his money.

The heat HAY PRESS on the Pacific Coast. County Rights, State Rights and Pressea for sale.
NEW GAS LIGHT for City and Country. BEAUTY, SAFETY and ECONOMY combined. You can buy a County Right for a few dollars and get the Lamp at cost prices. A full description furnished on application.
The only complete MUSIC FOLIO AND PAPER FILE HOLDER yet invented. Samples of either furnished on application. The entire Patent or State Rights for sale cheap.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1863, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, \$12 per year for forty weeks.
The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. v16-1y16p

RIDER'S GOVERNOR CUT-OFF ENGINE,
Manufactured by the DELAMATER IRON WORKS,
WEST THIRTEENTH ST., NEW YORK. The prominent features of this engine are: Economy equal to any; perfect regulation of speed by cut-off; entire absence of delicate or complicated mechanism; simplicity of design and non-liability of derangement; requiring no more care than common engines. NOTE.—This improvement can be applied in many cases to existing engines. Pamphlets sent on application. 26v20-3m16p

Pumps.

The general principles governing the construction of pumps have long been understood and acted upon, but there is still very considerable room for improvement in the special arrangements of the parts, for the purpose of ensuring efficiency and durability combined with simplicity and consequent cheapness. Hence it is that so many new pumps are continually being

the valves for the purpose of cleaning or repairing, it is necessary only to remove the bolts, K, K, which hold together the parts. The division, *n*, Fig. 1, separates the induction ways to the front and back end of the pump, as they extend into the box, *e*. By this arrangement the same stroke of the piston is both forcing and drawing water. The stuffing-box for the piston rod, *m*, Fig. 2, is made with cup-leathers, 2 and 3, set facing each other and within the movable

within the ring, 4, inside of which is inserted, moreover, a slight packing of elastic material, such as cotton waste. The packing at *a* is similar, only the position of the cup-leathers is inverted, as this is the moving part. There are other points for which we have not room. Our readers can judge of the pumps from the illustrations, and can obtain any further information desired, by applying to the manufacturers, Wm. S. Carr & Co., 106 Center Street, N. Y.,

Cheyenne, and a sojourn among the mountains. If our experience in Colorado can be taken as an indication of what their's will be, they may expect to have an excellent time and to meet with a hospitality which is unsurpassed elsewhere.

The completion of this road is an important date for the territory. The route passes through a part of the country which offers many inducements for the settler. Towns and cities will spring up rapidly,

A.—SINGLE ACTION LIFT AND FORCE PUMP.

B.—SECTION OF CYLINDER OF THE SAME.

C.—DOUBLE ACTING HOUSE AND SHIP PUMP.

placed before the public, and as the benefit of having good pumps is well recognized, it is always of interest to know of the late inventions. We accordingly make room this week for illustrations of a number of neat devices of this kind. A represents a single action lift and force pump, the construction of which is shown clearly in B. Here, it may be added, L, L, are leather packings, and the valves are cut from leather and loaded with brass, which keeps the leather in its natural state and does not harden it as did lead ones formerly used. C shows a double action house and ship pump, with horizontal cylinder, bedded into an iron frame and on legs, to be operated either with power or hand. Such a pump is particularly adapted for locations where there is a likelihood of rough usage, or where large quantities of water are required, as in factories, etc. The last cut (D) shows a cross-section of the valve-box in Fig. 1, and a longitudinal section of the cylinder in Fig. 2. To get at

ring, 4. The flanges of these leathers coming at the ends of the rings, are confined by the screw-cap, *n*, so that leakage along the outside circumference of the packing is effectually prevented. This device secures, as it were, a double set of valves, preventing ingress of air and egress of water. The cup leathers are protected from injury by standing towards each other

THE KANSAS PACIFIC RAILROAD is to be opened for regular business on the 1st of September. The completion of the road is to be celebrated by an excursion from St Louis to Denver, in which about a hundred persons of prominence will participate. The party is to start next Tuesday. The trip will occupy ten or twelve days and will include a buffalo hunt, a visit to

D.—LONGITUDINAL AND CROSS SECTIONS OF CYLINDER AND VALVE BOX.

and with all her great natural advantages for farming, stock raising and mining, we shall be surprised if the population of Colorado does not increase most rapidly. Already colonies are selecting this as one of the most favorable spots in which to settle, and foreign capital is being invested in the mines and lands. Now that the markets are brought so much nearer by two competing roads, we may expect a very great progress.

DENVER AND BOULDER VALLEY R. R.—This proposed road is the absorbing topic at Boulder, Colorado, according to the *News* of that place. The county is to vote whether or no \$100,000 in bonds shall be subscribed towards aiding the enterprise. Colorado is certainly progressing.

THE lecture before the Mechanics' Institute, last Saturday evening, was on "Climatic Influence," and was delivered by Dr. I. Rowell.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Placer County.

[Continued from page 122.]

Ophir and its Mines.

This little oamp (Ophir) is also surrounded by a very large number of good average quartz lodes. There are two quartz mills. One, a 5-stamp mill, owned by C. D. Pugh, has a capacity of crushing about 10 tons in 24 hours. Water is the motive power. The Empire mill is situated about one half mile north of Ophir, has 10 stamps, and a capacity of crushing 20 tons per day. It is owned by J. McFadden, who in person superintends it. He is at present doing only custom work, but will shortly build a mill on the Shipley ledge, a ledge that has been thoroughly prospected, averages \$14 to the ton, and has well defined walls from 2 to 4 feet apart. The Empire Mill ledges, 6 or 8 in number, are not now being worked, but are all equal, if not superior, to the Shipley. The St. Patrick mine, formerly owned by C. F. Eaton, was last week sold to Messrs. Gashweiler, Cronise & Lee, of San Francisco, for \$15,000, considered here a very small figure for it; they threw out at one blast, a few weeks since, \$5,000. Their shaft, is down 135 feet; ledge, 20 inches in thickness; the rock has run from \$50 to \$400 per ton (mill process). This mine is situated only a short distance from the Empire mill. About one mile south is the Reconstruction mine, owned by Scott & Co., at Dutch Ravine, who have a well defined ledge, a foot thick, which is averaging \$30 to the ton. Wm. Green's ledge, about one mile N. E. of Ophir, is considered the best in this country. It is about 30 inches wide and very rich. The fact that it is not for sale, and the amount of red tape necessary to obtain an audience with the proprietor, are sufficient evidence of that fact. I could get no particulars. Simons & Co. had 21 tons of rock crushed (from their claim in the Ophir district) a few days since, at the Empire mill, which averaged \$26 per ton. About 2 miles north from Ophir and 3½ miles west of Auburn, are situated the Buckeye company's ledges, 6 in number. This Company was incorporated under this name on the 18th of July last; but the mine has been successfully worked by Messrs. Lyon & Spear, of Auburn, for the last 15 years. There used to be a mill and an arrastra on the ground, but some months ago it was hurned down. Mr. Fred Jones is the Supt. He was considered one of Grass Valley's best quartz miners, and the confidence that he has in the mines has given an impetus to prospecting here that will accomplish wonders ere long. The Buckeye ledges run east & west, are about 4200 feet in length, and from outside to outside of the 6 ledges is 300 feet. Work has been done on these for a length of about 2300 ft. and a depth of 20 to 70 feet. One of the ledges, called the Buckeye, is 3 ft. wide and has yielded from \$10 to \$100 per ton. This rock is highly sulphuretted, the sulphurets assaying about \$200 per ton. The Elizabeth and Middle ledges, branches of the Buckeye, have yielded from \$14 to \$40 per ton. They have a good 16-foot water wheel with hoisting works and pump connected with the shaft. The expense of water for running this wheel night and day per week is about \$12. The Bear River Ditch runs near the mines with a good mill sight. There is water sufficient to run a 20-stamp mill, at an expense of about \$50 per week. Before leaving this quartz region, I must mention the Crater Hill ledges, 3 in number, owned by Messrs. Spear & Lyon of Auburn. These ledges, a few years ago, were thoroughly prospected, and all the rock taken out averaged \$50 per ton. Shafts were sunk from 40 to 70 ft. deep at that time. They are not now being worked for the lack of capital to build a mill.

L. P. Mc.

Eureka District, Nevada.

[Continued from page 122.]

New York and Secret Canons.

New York Cañon was prospected some few years ago, but only a few claims were located, and these being principally on base ore, not much work was done. Of course there were many claims to be found by the energetic prospector. Mr. W. C. Smith and others, who were convinced they could find something, secured a ledge, the May Flower, in the cañon, about two and a half miles from Eureka. Their vein is five to six feet wide, and their shaft is down some twenty feet. The mine contains very rich galena and looks well. There are several other mines in the cañon. The furnaces are buying ores of the "poor miners," who cannot afford to build smelting works themselves, and thus many are enabled to make a living.

Secret Cañon, known now as Vanderbilt, is about eight miles south of Eureka and in the same mining district. Here, as your readers undoubtedly know, is the famous Paige and Corwin mine, which I visited in company with Mr. Brown. The ledge varies from eight inches to four feet in width. The shaft is down 150 feet. Their ore is very rich, sometimes bringing from \$800 to \$1,000 per ton. They shipped 332 sacks to your city, which assayed, according to certificates which I have seen, \$397.25 in silver and \$38.86 in gold. The ore is decomposed and appears to hold fahl ore with horn silver, the latter sometimes beautifully crystallized. They have twelve men employed in sending the ore to San Francisco. The freight charges are \$30 to Palisade, and \$16 to San Francisco; total, \$46 per ton. The Eureka smelting works buy large quantities of the screenings, which are screened through fine sieves. There is not a mill nor a furnace in this cañon as yet, which is hard on the boys.

J. J. Basye & Co. have a fine location, about one mile from the town. The shaft is down 75 feet. One hundred tons of ore yielded about \$98 per ton.

The Bromide Hill M. Co. of this district have some ten claims, among which may be mentioned the Gem of Nevada, the Excelior and the Bromide. These all look well and show good ore.

The Hodgdon mine, on Hodgdon Hill, about one-half mile from the town of Vanderbilt, was taken up by H. A. Hodgdon, A. P. Hodgdon, E. A. Hodgdon and E. Colline. A shaft has been sunk 30 feet, an open cut run in on the side of the large deposit, and a large amount of work done generally. The vein is upwards of eight feet wide in many places, but would average, perhaps, only four feet. It is a most promising location. The superintendent, Mr. H. A. Hodgdon, informs me that last Fall they had a large quantity of ore worked, which yielded \$150 to the ton.

There are many other mines in this new camp, but time forbids my visiting each one. Responsible parties speak very favorably of the place. The Calico, the Stockton and some others, I did see, and liked their appearance. Messrs. Bertrand, Gaddes and Curtis are among the owners of splendid locations.

Spring Valley.

This small district is located ten miles to the southwest of Eureka, and contains some good mines. The formation is principally limestone, with some granite intermixed. The first ledge we came to was the Reeve and Berry, which has quite a reputation. The ledge changes continually, but seems to be from ten to twelve feet wide, and can be traced a long distance. They have a cut some twenty-two feet long on the face. The ore, which contains sulphurets, holds a large amount of silver, and some lots have been worked at the Austin mill and paid well.

There are other good locations as the

Murray, Mayott, North Star, etc., splendid specimens of ore from which have been showed me, and some very high essays.

Concluding Remarks.

The number of teams, which continually arrive at Palisade loaded with bars of argentiferous metal from the districts I have spoken of, testifies to their great importance. Most of the lead, I hear, is consigned to Newark, New Jersey, to be refined and separated. I am informed by gentlemen here that it costs \$15 for separating the lead and silver, and \$7 extra for extracting the gold, if there is any in the bullion. The reduction works allow \$1.29 per ounce for the silver, and 6½ to 7 cents per pound for the lead. The amounts smelted at Eureka I have previously mentioned.

I have already spoken at sufficient length of the great resources of the district,—the immense bodies of ore, the stone for building and lining furnaces, provided so near at hand by Nature, the agricultural capabilities of the surrounding region, etc. You know that after a series of excitements, such as have previously occurred, it takes an extra good camp to stir up people. I think this place is good enough to create quite a stir at any time.

A branch railroad to White Pine is urgently needed. This is most certain, and I hope and believe that the people will put one through. I likewise believe that the best and natural point for its junction with the Central Pacific is at Palisade.

W. H. M.

Eureka, July 10, 1870.

The Burro Mines.
